Well - - Thanks for all the replies to my question. Since the unit works,
I definitely will not toss it. My original intent was to use it for parts.
Is service literature easily available for cell phones? The unit I have is a
Nokia M11TXE which was made approximately 1990-1991 (based on chip dates). It

appears to have an RF board on the bottom and the control board on the top that simply plug together (after a little unsoldering of the grounds). I doubt if it would be practical to do anything to the control board, but mods to the RF board should at least be possible. As suggested by one respondent, my plan would be to use a PIC or even the parallel port of a PC to enable xmit and receive and to select the frequency. Not knowing the synthesizer that is used, it might be hard to do anything standard as far as xmit/receive split. One approach might be to use two cell phones, one for xmit and one for receive. As cheap as they are, this might be the easiest approach.

Thanks again,

Fred
WA0GMH

no>The only thing wrong with any of his report is the 2 ohms reading -
no>that's a real red herring.
no>73 de Bob, W9DMK

A further thought (me again): Suppose you accidentally misused a multimeter to measure the low R? For example having a lead in a wrong socket although the switch on the right range? Or - and I have seen professionals do this often - stick it on amps range and connect across something.

MIGHT account for a funny reading implying 2 ohms.

I can sell you new SV572B Svetlana valves. These are excellent valves
identical to the "old" 572B. The price is NOK 608.80 each or about
US$ 81.-
You can find a lot of other valves at my homepage. The address is
below in my signature.

Have a good day,

Arnold Goks&#65533;yr

After posting this message I went home and checked out the 900 MHz cordless phone that I bought two weeks ago for $50. It turns out that the handset transmits 902.078 - 904.030 MHz and the base transmits 925.999-927.952 MHz. Note that both frequency ranges are already within our 902-928 MHz amateur band. And it transmits FM.

I then tuned my scanner to these frequency ranges while my wife spoke into the handset. Sure enough it could be easily received. My phone has 40 channels. Everytime my wife turned off the handset and then turned if on again it switched to another channel.

At this point I couldn't resist taking the base unit apart. There was an RF module with a custom Kyocera board in it. Also a small Motorola microcontroller. This plugged into another board with a Uniden microcontroller and a few other chips that I haven't identified. A 9 pin header plug provided the connection. Each pin was clearly labelled - MD, TX, G, +B, LE, DT, CK, SQ, AF.

Converting these guys to ham use should be easier than cell phones. A way is needed to prevent it from automatically switching channels and to modify the base unit to route audio to a speaker and from a mike. According to the repeater directory the common repeater split here in California is already within the transmit and receive ranges of the handset.

I am a microcontroller engineer, not an RF engineer. But somewhere out there is a ham with professional experience in these cordless phones. Perhaps if we can identify common chipsets and RF modules I can write some custom firmware code to modify a few of them.

I believe you CAN have an arbitrary ratio if you resort to 2 separate windings, one being centre tapped, on the one former. Need careful tuning though; the tricks with coax stubs are much cheaper and easier, although they restrict you to certain impedance ratios.

1740. Impedance Matching

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-17 00:00:00 UTC
From: Herremans Kurt <Kurt.Herremans@skynet.be>
Message-ID: <34E9D615.BCF33077@skynet.be>
Source record: 86094

Hi there!

Can anyone take my doubts away?
The problem is impedance matching.
I have a filter from Toyocom type TQS-444A-7R with these specifications:
280 Mhz
Insertion loss 5.0 dB max
Terminating impedance 270 ohm // -5pF
I need this filter to become matched at 50 ohms.
I calculated a matching circuit myself, but I wonder if they are
correct. Here it is.

```
C1 C2
-----||-----(filter)-----||------ C1,C2 : 4p7
| | L1,L2 : 68n
3 L1 3 L2
3 3
| |
---------------------------------
```

Is this correct?
If I use these values in MIMP (Motorola's Impedance Matching Program)
I get a impedance of 50 ohm, this seems to be correct, but whats the use
of the -20dB return loss area?
Does this means the insertion loss of the matching circuit is 20 dB?
This would be to much, is there a better solution ?

Greetings

Kurt Herremans

Fore sale...

Manufacturer
BK Precision

Model
830 Autorange Capacitance Meter

Price: $100.00

Description
4x6x1, accepts standard banana connector leads, have slotted contact for those tiny tine ceramic disc caps. Runs off batteries or wall adapter.

Auto range with LED range indicator, LCD display, have fold out legs for bench use.

History
Bought new back in 1989 when I was into high end car audio. Used for approximately 1 year tuning filters (part time on weekends, less than 30 hours total).
Cardboard box is wasted, and can't find meter leads (probably with my VOM), and the wall power adapter has been long gone(probably used for some other gadget).

If interested, please email me at the following

NOTE I hate spammers, so if replying, please remove the c from my name in the reply address.

You might build one.
I mentioned wanting $75 each for my TU-x units from
an old BC375 (I think it is) and was told someone had
them for cheap as all get-out.

the switches in that gear only needed to handle a few
watts, but are capable of a cool kilo, I bvelieve.
They are military rugged, and made in a most inefficient
rig.

You can get them or something like, and rewire the poles
and if needed, add a second switch to shift from pole to pole.

It's a thought.

if you just want to operate on 40m amateur radio band cw/ssb direct
conversion - in order to use few or inexpensive components is suitable,
but if you wish to include AM a regenerative concept is better.

It is important to bear in mind that 40m band is the worst band to
choose, we suffer bad overload problems from very strong broadcast
stations close the the amateur radio band.

Application of NE602 is rather biassed, it is not always optimum - 25
years ago one should use JFETs in every QRP application, later 40673 -

whether they were suitable or not . It is also another problem to consider. Local oscillator must be screened from radiating into the air or through the powersupply, or you will receive a constant hum carrier all over the frequency tuning range.

I really doubt what sort of experience is possible using a single NE602 - as demodulator - and a single LM386 in the audio, at least some audio amplifiers are missed. It is easy to improve this by adding few bipolar stage amplifiers and simple audio filter (88 or 77mH telephone line pupin coil or other).

To avoid this, it is better to use a subharmonic mixer.
I built a very sensitive direct conversion receiver for 7/10MHz using the russian RA3AAE type 2x1N4148 antiparallell diode mixer with 3.5/5MHz local oscillator. I used only inexpensive bipolar transistors (BC238/MPS3394/2N3904) in the audio and oscillator stages.
With a simple cascode RF amplifier I could easily hear a 0.1uV carrier from Wavetek 3001 signal generator, and it worked well on the air. Some parts of my design was shown in Radcom /Technical topics(G3VA) few years ago. To switch the input tuned circuits you just double the capacity going from 10 to 7MHz (and to switch between 14/10MHz you have the same relation).

This is posted on the QRZ new mods database:

Extended (MARS) frequency modification for the Kenwood TH-235A is as follows:

1. Switch off the power and remove battery pack. Remove three (3) screws from the back of the transceiver. Locate the DC and MIC jacks and remove the plugs. Carfully seperate lower part of the back cover and remove from the handheld.

2. Remove the inner partition. First lightly push the charging electrodes and pass them through the holes of the inner partitiom.

3. Remove antenna, VOL and Tuning control knobs. Remove rubber cover from top of radio.

4.Remove inner assembly and locate green wire soldered to two (2) pads behind the Volume control on the PC board. Carfully unsolder one side of the green wire, tape that end off so it will not come in contact with any other part of the circuit.

5. Reassemble the radio, reset the microprocessor by pressing [F] and the Power on switch at the same time.

This should allow transmit operation from 136.00 MHz to 173.995 MHz.

Remember, unless you have authorization to transmit outside the amateur frequencies, you can risk losing your hard earned license.

Hope this helps.

1754. Transmtitter module for rocket

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-17 00:00:00 UTC
From: George Fradl <gfradl@gatecom.com>
Message-ID: <34EA4BE4.88E28988@gatecom.com>
Source record: 86108

Greetings, I am a radio amateur as well as a high power rocketeer.
I'm planning on launching a minimum diameter rocket with a 38 mm motor this summer. This rocket should reach aprox. mach 1.2 and an altitude of 7000+ feet. There will be an altimeter on board that gives its output as a series of tones on a beeper, this output starts once the highest altitude has been reached.
I would like to add a transmitter to the system and feed it with the beeps from the altimeter, this will tell me the altitude before the rocket is back in sight and give me a way to track it in case I never regain sight of it.

What would be the best mode of operation F3 or A1?

Is 500 mw more power than is needed?

Does anyone know of any place that sells VHF transmitter modules that would work in this application?

Does anyone know of any good plans for a transmitter that I could use for this application?

Please send responses to mail so I won't miss any.

Thank You,
George Fradl WD8EBZ gfradl@gatecom.com

To whom it may concern,

I would like to get into the hobby, and learn a little about Haming.
What would be a good radio to get, I would even be willing to build a kit if
it came to that. I would like something with a minimun of about 2 meters.
Any sugjestions?

Don

It's been a long time since I looked at the 723 data sheet, but doesn't it have some sort of current sensing connections? It should be pretty easy to wire it up to limit the output current to a particular value, regardless of output voltage.

Foldback current limiting (where the current is reduced as the output voltage drops) might be more difficult. Best thing to do is find a databook that shows the 723; it will have a bunch of sample circuits.

>I take 2N3055 as series pass transistors 4, but I don't know how to match
>the transistors. Does somebody know about what type/ Trademark of 3055 are
>the best

Put a small resistor in series with the emitter of each transistor, something like 0.1 ohm. Then connect the other ends of the resistors to the output terminal. This provides negative feedback to keep the current approximately equally shared between all the transistors.

The way it works is this: If any one transistor passes more current than the others, the voltage drop across the emitter resistor increases. Since the bases of all the transistors are connected together, and the "far end" of all of the resistors are connected together, the sum of emitter resistor voltage and base-emitter voltage is the same for every transistor. Since this particular transistor has a higher voltage drop across the resistor, the base-emitter voltage is reduced. This reduces the base current on that transistor, and thus the collector current, until everything is back in equilibrium again.

This should do a pretty good job of balancing the current through even a poorly matched set of 2N3055's.

Dear Madjid,

If you are an ordinary, common sense educated feller, as I think you are, you do not need a kit or set of plans. Just make a mini-loop out of junk materials. The only part you may need to buy is the tuning capacitor which has to be a high-voltage, wide plate-spacing variety.

Operate the antenna well above ground. The larger the diameter of the loop compared with a wavelength the more efficient it will be. It does not have to be circular. It can be square, triangular or hexagonal. There is no such thing as optimum size.

To compare a loop of one set of dimensions with another loop of another set of dimensions, download my RJELOOP1 and RJELOOP2 computer programs from my web site. Much better than so-called free-ware. New, original, professional standard, software. Not re-hashes of anyone else's cast-offs.

Programs not Zipped up. Can be downloaded within 10 seconds and put into use immediately on an IBM compatible computer. Other useful programs are available while you are on site. Read the "Browsing + Download" section.

Good luck and good DX.

Reg G4FGQ

1770. Heath HW-16: AGC where AGC has never gone before

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-17 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19980217010401.UAA08054@ladder03.news.aol.com>
Source record: 86218

Thirty years ago, as a novice, I built an HW-16. It worked great, and I loved using it.

Three weeks ago, I purchased a nice, used HW-16 in great condition (I am revamping it for my 7 year old son who is in a novice / tech plus class). Thirty years of experience and an EE degree now makes me realize that the HW-16 never had AGC! I guess what you never experience, you never realize what you are missing. Now I know why the radio always sounded so "transparent".

I'm looking at adding AGC to the receiver so that my son won't hurt his hearing as I probably did listening to static crashes on 80 meters many years ago. Although it is probably closing the barn door after the cows are out, I'm looking at audio-derived AGC as a simple possibility, thinking that with CW this is probably an effective solution. This was the approach used by several Heath radios including the HW-12/22/32/18 series and others.

I'm wondering if I am reinventing the wheel here. Sure, I could add another parallel IF stage with an MC1350 IF amp and IF rectifier, but I'm looking for something fairly simple. It looks like the RF gain pot varies the bias to the RF and IF amp tube cathodes from about 0.2V to 3V for cutoff. I'm thinking that I can rectify some of the AF and use it to control the gain at that same point. Has anyone tried this or other solutions for AGC on the HW-16 and what has been your experience?

Please reply directly to WB4LNM@aol.com or to the list. Thanks.

John...

We have written a Toroid software package for use DC to 300 Mhz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining cusom phenolic cores from plastic, teflon, wood, ect...
Download a demo or just view the software main screen at our web

>Would you explain this phenomina?????

Let's take the 100kW as correct - even though it's suspicious. Let's
also take the 9v, 280 ampler filament as correct - that's not so
suspicious if the amp really is 100kW. That says the filament circuit
is nominally 0.03 ohms hot. OK. Now he turns on his filament supply
to test it and everything is fine, except that for some reason the
circuit breaker trips and he is losing the load. Why? Perhaps the
filament is kaput? He tries to measure it. Bad idea. Measurement of
resistances in the range of 0.03 ohms is not something you do with a
Model 260 Simpson Meter. So, let's assume that his measurement of
resistance hot, cold or in-between is pure waste of time, because of
inappropriate procedures, inadequate test equipment, or whatever.

My suggestion, Kwak Jong-Gu, is to put a current probe and an
oscilloscope on the filament supply leads and let's capture a picture
of the behaviour of the filament current as the test proceeds. If we
are lucky, we will be able to see a spike in the current flow to the
filament that would explain why it's tripping out. I'm not familiar
with the latest technology in O'scopes, but isn't their something
around that could capture a transient with reliability? Say, for
example, a means of recording the current sensed in the current probe
in a high speed memory device?

Source record: 86222

I just bought a Kenwood TH-235 2 meter HT.
The 60 memorys in this radio can be "cloned" to another
TH-235. It does this by sending (transmitting) DTMF tones
from the source radio to the target radio.

It sends for about 205 seconds and the rate is 10 DTMF tones
per second so this makes about 2050 total (maybe 2048).

I was wondering if anyone has mapped it out yet or maybe has
a program that sends DTMF tones from a sound card?

I need some clarafication on something i was told in line with a power output problem IVE been having.
first ....i have a dualbander that on UHF puts out more power on the lower edge of the band than the top.

now another ham told me after getting the repair manual from yaseu that i should check the vco voltage and compare it with the specs in the manual.

well, the voltage is a little low, but the radio is on freq across the band.

so, my question- is the other ham right in saying that the vco voltage is causing the low power output. and if this is true do i need to realign the radio according to the procedure in the repair manual

Hi John

Have you considered using diode clippers to limit the audio without AGC?

I had an old NC-155 and found the AGC would follow strong signals close to the one I wanted. Putting a diode limiter across the headphones and turning off the AGC cut back the strong signals and still let the weak ones through. There was far less distortion than I expected. You still have to ride the gain controls and I would not try it on SSB.

If I may suggest the posibility that the rotary switch from an old TV set that used 2-13 vhf channels may work. If you could find one of these old tuners and check it out it may be the ticket.

>has been your experience?

I don't know anything about the HW-16, but will mention a general
caution anyway. You'll have quite a few stages in the loop. If any of these
has appreciable phase shift at audio frequencies, you'll have a real chore
getting the AGC to act quickly but stably. I doubt that you'll be able to
make a good-quality AGC if an audio filter of any selectivity is in the
loop, for the above reason. But if the rig does have an audio filter and
the filter is downstream from the loop, you'll have the possibility of
weak-sounding signals working the AGC. Therein lies the problem of making a
good audio-derived AGC.

I've made a really clean, quiet, fast-acting AGC by adding an MC1350 (and
zero-bias emitter follower to rectify and charge the hold capacitor) to an
existing IF. If you won't settle for a thumping, squawking AGC, you're
likely to find this approach less time-consuming in the long run.

>
>

That's right... an easy way to go is with 45 degree elbows and copper pipe, if you are not comfortable with bending pipe. The bigger the better, generally... efficiency drops way off below about .05 wavelength. Also, bandwidth can acually get so narrow that you can't get a good fone signal out or especially receive an AM BCST signal properly. Q is very high on these loops. That is one reason MFJ's 3 foot loop is only rated for 10 MHz and above. Plus the capacitor gets bigger and bigger with smaller loop diameters.

The capacitor can be homebrewed as well, and this will save you a LOT of money. Just TRY to find a high quality split-stator capacitor rated at 3 or 400 pf and 5 KV for under 50 bucks! You can make a "trombone" style split stator unit out of copper pipe and teflon. Check out the NOV 94 issue of QST. There is a complete design for a compact loop. If at all convenient, size it up to about 8 feet diameter and go with 3/4" or better copper tubing. You will be glad you did.

Reg's programs bear this out... check out efficiency with varying loop sizes, from .01 wave up to .25 wave. There is a definite curve there. Also look at bandwidth or rather Q of the antenna. Sometimes narrow bandwidth is in your favor, but you can get too much of any good thing. Also, when capacitance required to tune the loop gets up to a few nanofarads, the capacitor becomes problematic. There are some VERY high voltages on the far side of a small loop, i.e. at the capacitor., and you will end up with a baterry of capacitors bigger than the loop if you get too carried away, or else you will be arcing across and burning the caps up. I would definitely stay up at 1/10 wave or bigger for HF... thats around 5 foot diameter for 7 MHz.

Can't you use the trifiliar type balun and just remove or add a turn or two to
the winding between unbalanced hot and the connection to the next winding and
the near side of the balanced output? Seems like you could fudge it a bit and
still have a balanced output. Maybe I am missing something here...hope I'm not
leading anybody astray...

OOPS! I wasn't very clear... I didn't mean to use the hamcomm device for
satellite... I suggested getting started on HF first to avoid spending a sack
of money right off the bat or doing a lot of fairly complex homebrewing. JVFAX
does support APT modes, but the comparator type interface doesn't.

I have heard good things about Dr Taggart's interface design and wondered if it
would work with JVFAX... I guess now I know.

You can get tons of free (tho used) magnet wire from
television CRT deflection yokes. Another reason to
score a junker TV from time to time.

Your challenge -- devise an easy method to unwind the wire
from the yoke, wind it onto a shuttle, and then wrap literally
hundreds (or thousands) of turns on the variac core.

I have an old 73 article on rewinding "pole pig" transformers
that describes a method of wrapping wire on a cardboard core,
then slipping the windings over the (disassembled) iron core.

Email me for a copy (you'll need to return a greenstamp;
IRCs or US$-equivalent in ANY foreign currency accepted)
but you have to be smart enough to un-munge my address
to be able to get information on winding HV transformers.

Tempo Research took over the antenna and test equipment part of
AEA. The digital equipment went to Timewave Technology Inc.
Timewave will service a PK232, but they aren't building any more
of them. They're concentrating on the PK-12, PK-96, DSP-2232,
and DSP-232 boxes. Timewave's website is www.timewave.com.

Hello Kurt,

John Franke has properly answered your question, but I don't know if
you really understand what his answer refers to.

When someone describes a termination as having 20 db return loss, they
mean that that termination is a match to the specified transmission
line's Zo, over a specified band of frequencies. Any mismatch that
occurs within that passband will produce a reflected power that is 20
db below the incident power - just as John said.

However, in your original post you did not specify a bandwidth. I
suppose that if we were familiar with the specific filter from
Toyocom, then we would know of the bandwidth. Nonetheless, I am
concerned that in spite of all these favorable numbers, the two L-C
matching sections that you have used are in themselves going to have
some effect on the bandpass characteristics of the filter that you are

starting with.

It has been my experience that when your situation arises, the usual approach is to use a broadband transformer to perform the necessary impedance matching. However, stay tuned for some more knowledgeable responses from others, because there is a lot of high powered experts out there who know much more than I on this subject.

Good luck - you are quite justified in have doubts.

To all that can offer assistance

I believe there are things called packet radio internet gateways. What i want to do is to have FULL Internet access (not just EMAIL) through packet radio, via the said gateways so as to do away with my ISP which costs me £12/month, and the PHONE bill, which I think is a disgrace that we have to pay for. We pay for calls to the Internet in England!!!!!!

PLEASE NOTE:-If you have never heared of an packet radio internet gateway, DONT reply to me saying youve never heard of it, and its not possible, because I jolly well know it is possible, this would obviously be the first time you have heard of it, so DONT bother to reply to me. If you DO know what I am talking about, I would very much welcome your input.

I need to know what equiptment I will need to do this, the cost, and if there are local gateways operating in the MHZ freq. range that will be able to cope with a high speed packet radio modem (56K + baud), in the NorthWest region of England. From reading stuff off the net it wont cost a fortune to implement all this. I apparently need a TNC (Terminal Node controller), radio, amplifier, and Antenna, and anything else you might think I should need. Read some info about JNOS too, presume its possible to run TCP/IP over that, with WIN95, and all the traditional internet application programs running all above that, FTP, email, Netscape browser etc etc etc. I hope to run all that little lot from a 486AMD5x86-P75 ,256K cache,16MB, WIN95, which will more than meet the needs of the Packet radio interface.

If you can help would appreciate it

Cheers

Ian

1794. Hunting AMP Parts

I am off on a building project. I am going to build both a pair of
3-400s and a single 4-1000.

Looking for the following, will trade, buy, scrounge, and or beg.
Donations accepted and appreciated. Pointers to sources appreciated,
thanks in advance.

Large roller inductor for PI network
Air Variables for PI network
Vacuum variables for PI network
High wattage resistors for input T-pad
Sockets for 3-400s for use with chimneys
Another 3-400
Socket for 4-1000
Chimney for 4-1000
4-1000
Plate transformers - 3KV to 4KV
Filament transformers for 3-400s and/or 4-1000
Miscellaneous door knob and blocking capacitors
B&W bandswitch with inductor(s)

Anyone with a fried, trashed, or otherwise AMP with parting value, i.e.,
SB220/221 or something similar. Homebrewed certainly acceptable.

Have on hand to trade:

SB-102 w/Power supply. Tubes overall in good condition. Finals fine.
Can and will pull all to test.
One Westinghouse 813 - New.
EF Johnson socket for 813
Plate cap for 813 and similar sized caps
Junker HW 2036A
Stack of Heathkit manuals - New.
Also have typical parts horde.

Hope to get some good hits!

Thanks to all,

Bob Bethman

> starting with.
>
The passband of the filter is 280Mhz +/- 4Mhz (1dB)
Am I right when I think that the bandwidth of the LC matching circuit is
very wide (low Q value of C and L), but the filter has a narrow
bandwidth so the result will be narrow bandwidth ?

> It has been my experience that when your situation arises, the usual
> approach is to use a broadband transformer to perform the necessary
> impedance matching.

The filters are SMD versions, and I would like the rest of the circuit
to be too. Isn't a transformer to big ?

Kind regards,

Kurt Herremans

1800. What homebrew rig is best for me - information

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-18 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <34eb3d4e.0@newshost.pcug.org.au>
Source record: 86049

I've noticed many people asking about QRP gear to build and what to look for in a homebrew project, etc.

Well, much of this information is now in the web. Under the heading 'QRP Best Buys' on the Australian QRP Home Page, there is a detailed look at the sorts of transmitters and transceivers that are recommended for first-time projects. The comments are realistic, and try to strike a happy medium between equipment that is very simple but is frustrating to obtain contacts with, and more complex gear.

The URL for the Australian QRP Home Page is:

http://www.pcug.org.au/~parkerp/qrp.htm

Novice Notes Onlime also has information on selecting an HF rig. Both used commercial transceivers and homebrew circuits are examined in detail. The URL for this page is:

http://www.pcug.org.au/~parkerp/nonline.htm

Hope this helps.

Only problem I see is your expectation of 56K access over the amateur VHF
bands with (ordinary?) radios. NOT easily possible, if at all. You'd need a
broad band type transmitter receiver (2) and that won't be as easily obtained.
Most high speed amateur user operations are at 9600 baud now... that's about
the limit of ordinary ham gear... and far too slow for regular internet web
access.

Message-ID: <34EB7A61.50E2@taxes.net>
Source record: 86056

The 2% caps should be fine. If you have access to the necessary
test gear to test and match a big handful of these caps, life
is good -- if not, you should be close enough to get pretty good
performance. Your filter roll-off change will be minimal.
You can analyze the circuit and maybe see a 50-hz shift in the
3 dB roll-off point. (Hint -- you can't hear that. Build
it and have fun!)

Not to talk ill of the dead -- W1FB made a significant lifetime
contribution to our hobby -- but it's been a long-standing
bad habit of ARRL, its authors, and its publications to
print plans that call for parts made from "unobtainium."

Considering how much JUNK we actually build projects from,
anybody designing construction projects for amateurs should
take a hard look at the real requirements for precision, thermal
coefficients, and parts availability, and specify accordingly.

Saying "Use part X" isn't as useful as saying "for oscillator
start-up and stability, choose part X based on thermal
characteristics and voltage tolerance (NP0, 100 volt recommended)."

W1FB knew how to do this. Nowadays, the ARRL has the staff
to review the classic circuits and fix some of these things
that could be improved.

Source record: 86058

Hello
I am trying perhaps am imposible project. I'm trying to convert a Motorola Mocom 70 to a mobile repeater for the Fire Department I work for.
The input and output frequencies are approx. 8 mhz apart.
I have managed to get the receiver and Transmitter operating separately.
I have also managed, although not perfectly, to couple the audio from the receiver to the transmitter, but I believe I need a matching network to provide the proper impedance between the two stages.
I also need to build a COR circuit
I need help from anyone that can help me to finish this project with any ideas you might have for matching circuits and COR circuits and where to properly place them.
Any helpful comments are welcome.
Thanks for taking the time to read this.

Don't touch the VCO. The voltage for the VCO (and most other) test
points is nominal. The change in power across the band suggest a
mismatch to the antenna. By how much is it changing and what are you
using to measure the power?

Another short point. In a sailing vessel, the foc'sle (derived from forecastle?) was also the most likely downwind point in the vessel. Therefore, the least desirable real estate, especially after six weeks at sea hauling a cargo of goats.

1813. WTB : 10 GHz Gunplexer

For Sale...

Bandpass Cavity Filter. Tuneable 136-174 Mhz.
Presently tuned in 2m band. Cavity is 7" diameter by
2 feet tall, (overall height is 30"). N type
connecters. Manufactured by Sinclair Radio Labs.

It has 1db insertion loss and signals 2Mhz
away from the tuned frequency are down 18db,
signals 5Mhz away are down 26db.

I can also tune it to your freq.

$ 75. + shipping (about $10.)

The old GE / Ericsson CarFone series should be an easy hit. It had
three seperate boards, one for audio, one for logic and one for RF.
You can find these units at many hamfests for about 20 bucks.

There's another kind of homebrew, where you try not to buy anything.
I've become more fond of that version since becoming almost penniless.
Have to ignore safety regulations somewhat, though!

What do you want it to DO? That, for a start, would let me choose an
appropriate waveband and power level. Without knowing that, there are
too many hundreds of possibilities.

You could always make up the 0.015 uF capacitors by parallel
combinations of 1% capacitors.

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 Whats is L.O.S.A all about ?
--------------------------------

I started to compile L.O.S.A because I know there are lots of great
ideas and many problems that are solved with the BASIC Stamp and the
main purpose of this list is to get an idea of what other people are
using their BASIC Stamps for and maybe get some inspiration or hints.

1.1 How can I contribute to this list ?
---------------------------------------

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

Spring is on the way and someone who is thinking BIG
should consider this:

unused 4-1000
used 4-1000
unused socket (for 4-1000)
unused fil trans (for 4-1000)

Keep your eye peeled on trash collection days and
before you know it, you'll have a couple of microwave
oven transformers to use for your for HV supply.

$200 FOB Atlanta.

>

I agree that IF filtering is definitely superior to audio filtering and if you can get an IF filter for your TS520S go for it. In spite of that, I want to comment that the switch-capacitor audio filter in the last couple issues of the ARRL handbook might be a better audio filter solution. All the parts are available from Digikey, it is easy to build, has adjustable bandwidth and center freq, and it has excellent filter characteristics.

In addition, if you get the data sheets on the chips you can easily modify it to different bandwidth setting simply by changing a few resisistor and switch combinations.

I operate CW almost exclusively and recently faced the same situation as you with an old Drake TR-3. The 2.4 KHz SSB IF filter just didn't cut it on CW. I now use a TS520S (with the IF CW filter) and still find this switch capactor filter useful.

I think parts are much more readily available now than in the past, and they are much more capable devices. The problem isn't that you can't get parts, but that some parts (usually the key items) are hard to get.

There was a place in Montreal (North American Electronics) that carried toroids and other radio type parts. But when I went past there earlier in the year, it had closed. They were a holdover from the past, the sort of electronic store that used to be common. I can think of only one place locally that still exists from when I first became started going to electronic stores in 1971. It is too bad about North American, because while the toroids were more expensive per unit than mail order, they were close by and I could by one at a time.

I don't know of any other places in Canada that sells toroids, let alone sell them by mail. They might exist, but it most likely is a similar type place.

There is a small list of electronic stores that deal with the hobbyist in Canada at
http://www.paranoia.com/~filipg/HTML/FAQ/BODY/F_surplus_ca.html

It's not very comprehensive, and I'm not sure how up to date it is. It would benefit us all if any Canadians have experience with other places to send in the information (there is a link at the site for doing so). The list is mostly Toronto-based.

I picked up some Mosfets (though I haven't used them or even tested them) for a dollar each at one of those dollar stores that are common here in Montreal. They were actually preamps for the FM broadcast band (I'm not sure I'd want to use one of them for that, having traced out the circuit). I bought one, opened it up and discovered the mosfet, and bought as many as were left when I could return to the store. Sadly, people had been buying them in the interim.

One of the problems we have in Canada is that the population is so low and so spread out that we really don't know what's going on in the rest of the country. I remember when ETI started a Canadian edition back in 1977, and it was so great to see the ads for electronic stores in the rest of the country. I think some of them benefited, at least for a while, by having a magazine where they could reach interested readers throughout the country. The magazine eventually folded (it disappeared without any comment), and we lost that means of communication.

So we end up having to order from the US. I hate doing mail order, having to work up an order, and doing it across the border is just that much more trouble. I was all set to finally order some parts from a place having a sale in December, finally doing what I'd put off for months, and when the state of the Canadian dollar hit the news, I didn't even want to think about ordering from the US. I've never given much thought to ordering from the UK, but at this point it might be worth consideration.

When you start talking about radio parts, the problem is compounded by the fact that the places selling radio parts are less likely to sell the common parts that you might also need, so you might have to order from more than one place.

Anyway, one place that you might look into is Dan's Small Parts. He has a website at
http://www.fix.net/dans.html

I ordered from him a few years ago, and I was satisfied. I'd be making more frequent orders there wasn't the need to order enough parts to justify the $8 to Canada postage and handling fee. You can get toroids from them, and small signal mosfets, along with a lot of other neat items for radio building.

I am presently working on a 5Watt QRP from Oak Hills OH100, the kit is fun
and it looks like it will perform well. They have it on special for $100 at
the present time. It is for CW only and a single band of your choosing.
You do have to wind your own torroids (havent gotten to that step yet but
it should be fun also). Take a look at their web site and see..

1842. Re: FULL INTERNET Access VIA Packet Radio??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-19 00:00:00 UTC
From: moss.i@virgin.net
Message-ID: <34ec8eb5.4754106@news.virgin.net>
Source record: 85999
Cross-posted to: uk.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Firstly I would Like to THANK DAVID TSE for his very informative and HELPFUL reponse to my intial posting, CHEERS DAVE, I will ask you a few things in a moment

Before then I would just like to respond to (I KNOW I SHOULDNT!!!! but I am going to) the other previous respondees, who were of absolute NO help, and I suggest have responded to these series of postings because they wanna flame!!!!! SIGH.

Why I want to connect to the net without an ISP, is to improve my connection speed (hopefully) have a closer more intermate internet connection to the NET than my ISP can provide (do away with firewalls etc BECAUSE I wanna experiment with net) and NOT have to pay the PHONE bill. The Americans dont pay for local calls to their ISPs, until that happens in UK, I want another way of connecting that doesnt invole a phone bill. If people wanna pay for their Internet connection, well I aint going stop them. But as for me I want to explore the various technological solutions to this problem, because a) its interesting, b) will save me money, and c) will provide an answer as to wheather its possible to implement realatively cheaply.

In response to WALT davidsons comment, I dont mind paying the ISP costs but the local phone call cost I do object to paying for. It goes against the very spirit of the Internet. In America they can leave their computers connected to the net 24hours a day 365 days a year presumably, and all they pay is the ISP. Well thats What I want too over here.
Further while ever there are people like you Walt, who are happy to go along with the main stream, progress will be slow. The Innovators through history have always been the people who have not been satisfied with the way things are.
I have even considered a small cheap two way SAT link to the NET. Apparently Bill gates has one up on me on this one, apparently he intends to implement a SAT system which would enable anyone with a 2 way sat link, (which units i think he is going to develope which will be very cheap), to link to the NET.
I too think for better communications, much improved speeds and services, it would be better to connect to the NET NOT via a modem and PHONE line, and to dispense with that archic part of the link altogther. So I am not the only one who thinks the modem phone link is a bad idea.

Right so having outlined my reasons for wanting a different way of connecting to the NET I will now go on to respond to the points made

by David Tse

>There are no off the shelf TNC which will give your 56kbps air speed
>(or more). There are packet modems which are in use by various
>people, but not with a TNC. An example is the WA4DSY "GRAPES" modem,
>to be used by the P.I. synchronous I/O card by the Ottawa group. By
>the way, speed is measured by bps (bits per second), baud is not used
>commonly anymore as it refers to the change of phase per second, which
>does not correspond to the speed issue.

I Dont mind having to implement the link David by I/O card, and modem, infact this was the initial way I invisioned it to be done. I just read somthing about a TNC. I presume then David if It were possible to implement the link via Single PC (by the Way I have some 386s hanging around doing nothing) I would need the following??

PC--i/o card--Modem--Radio--Amp--Antenn

Then the software that would implement the TCP/IP levels and communicate with the tradional Internet Application Progs would be the Flexnet software you mention below, is this a commercial piece of software?

>Although JNOS might run under Windows, I am not aware of JNOS having a
>socket link or a network interface presence to Windows (95 or not).
>In order to use "traditional" internet apps, you need to use a stack
>which has connection with Windows networking interface. FlexNet is

>aware of FlexNet supporting the 56kbps GRAPES or any high speed packet
>modem (yet), although they have a modular design which gives it a
>future possibility.

> In order to have the connection
>with the user, (we are only doing a short hop point to point now), we
>are currently building the 56k as a repeater to be put somewhere high
>up on mountains. Stilll people with no line of sight to these
>repeaters will not connect as any reflections will distort the signals
>badly.
>
Whats the max. range (in miles) of line of sight comms so as to implement a 56K connection for eg?

From your posting David then, I take it that full internet connection with all the traditional internet programs is possible to implement and that what I wish to atchieve is possible.

The implemtation of a Gateway you mentioned 56K wirth ethernet link is interesting way to do it, and as you pointed out may be the only way possible with speeds of 56K and above. But Hopefully my research will determine wheather it will be possible to implement a stand alone PC connected to modem and radio as outlined above for 56K and above.

Any Idea of costs involved David

Cheers

Ian

These high speed links are normally on a point-to-point basis, not for general user access, normally for mail links etc. I think they are normally on the microwave bands, probably 10GHz.

Normal BBS/node access is 1200baud or 9600baud. Don't forget that is the maximum uninterrupted data transmission rate - the actual throughput is dramatically reduced when the data is packeted (if that's a word?) and after collisions with other stations' transmissions. As an indicator 1200bd will facilitate a data transfer of 60 bytes/sec on a reasonably clear channel.

Even if you can get a 56k user access to a node don't forget that node won't be the gateway to the 'net. The TCP/IP routing will go through a number of other nodes which could be any bandwidth you care to think of.. and yours won't be the only TCP/IP traffic.

..Then don't forget BR68 1(7) and the other sections regarding message content.

Get an ISP with a local call number, put that in Friends & Family (if you're on BT) and save the surfing for the weekends. Then it's only 0.9p / minute.

(or alternatively you could work for a company with an internet-enabled network and RemoteAccess with dial back :o))

Can anyone tell me what years the ARRL handbook contained the following
construction projects: (not exactly sure on project titles)
*"Simple Beginner's Receiver" featuring a single 6C8G regenerative
receiver operated from batteries; plug-in coils for 3-4 bands

*"One-Tube 6L6 transmitter" using a crystal controlled 6L6 (maybe 6V6)
on a breadboard (!)
I have thought for years these projects were presented in the 1947
Handbook, but just having procured a copy, am disappointed to find 1947
seems "too modern" for these projects.
Thanks in advance for any help.

I'm certain the copy of "How to Become a Radio Amateur" that I bought in 1971 (sadly I gave it away years ago) had a 6L6 transmitter built on a piece of wood. I can't remember what the receiver was, though I'm quite sure there must have been a regenerative receiver in there.

Perhaps it was in that book, at least an earlier edition, and not the Handbook, that you remember? Are you looking for this type of project, or are you trying to find the exact articles that you built from years ago?

If you're looking for generic articles, they must be all over the place. Looking at a 1961 Handbook, there is a single tuve transmitter, though using a 6DQ6. A simple regen receiver, and a single tube transmitter, were simple enough that they were bound to be a standard over the years.

Does anybody know where one can find schematics or kits of beacons which can be used for balloon operations or DFinf (foxhunting). Can any of these beacons also identify themselves every 10m and give some sort of tone to make them easier to track than an unmodulated carrier.

A 56K packet link should be able to replace a phone line for local communications. If you happen to own your own ISP, this could allow you to have Internet access at home without paying phone charges.

The problem for most people is: what's on the other end of the radio link? It's probably another computer, and *it* still needs at least a 56K connection to the Internet at large. How will you provide this connection? If you have your own ISP with its own T1 connection, you just run a wire from the machine at the far end of the radio link into your main router. But if you are using a commercial ISP, you have to convince *them* to provide your far-end computer with a connection. And you probably have to provide both ends of the radio link yourself.

At the UBC amateur radio society, we have a couple of machines with full Internet access provided entirely by radio. There is one 56 kbps radio link, and another 2 Mbps link. But the "far end" of the one link is a machine in the electrical engineering building, and the "far end" of the other link is a machine in the student society offices. These machines, in turn, are connected to Ethernet or better networks that cover the campus, and have a pipe to the outside world that is at least 10 Mbps. So the radio links "extend" the campus network into machines that are not otherwise connected. But without the physical network links (copper and fiber) that covers the campus, there would be nobody for the radio-linked machines to talk to other than themselves.

Dave

P.S. I trimmed the list of newsgroups to ones that seemed at least somewhat relevant to the subject. Spamming your message to every newsgroup with "radio" in the name just means you're too lazy to figure out where your question really belongs.

Hi Peter,

I think you are looking for the magazine now called "Microwaves &
RF";
a Penton Publication. Its available as a complimentary subscription for
those who are involved in the industry. You can access their inquiry
website at:

www.penton.com/mwrfinq

I've been getting it for years but I think it used to be called
simply "RF Design".

A local engineer told me that most CB will work OK well into the VHF.
he said to use it in the normal fashion and record your readings, and
the reverse the transmitter and antenna leads and use the meter again
while reversing the forward and reverse adjustments, and record those
readings. If the readings are relatively close, the meter may be
accurate at that frequency.

>low. The only other consideration would be exceeding the design voltage on
>the transformer by a small margin..I don't think it would be a problem in
>practice....

You might well cook the transformer. It's true that the insulation used
in the transformer will probably withstand thousands of volts, so a little
extra voltage is not a problem for it. But the transformer core will be
designed to have just enough iron to stay out of saturation with the rated
voltage applied to the primary. Apply more voltage, and the core magnetic
flux goes up. If it goes up enough for the core to start saturating,
the inductance of the primary drops, and the transformer starts drawing
substantial current from the line with no load on the secondary. It
will get very hot.

It's generally OK to operate a transformer at a lower voltage than it's
rated for - in that case the core is larger than needed, but no harm
is done. But operating at higher than rated voltage is a bad idea.

1867. Audio Freq CW Filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-19 00:00:00 UTC
From: Trapper_SPAM_27@juno.com
Message-ID: <34eb90c1.201464@nntp.infoave.com>
Source record: 86063

I am attempting to build an Audio Frequency Cw Filter as described in W1FB's "QRP NOTEBOOK" pg 66 Fig 3-21. The circuit is centered around a TLO series biFET Operational Amplifier.

THE PROBLEM: The Circuit calls for two Polystyrene Capacitors of a value I am unable to locate. The schematic shows them as 0.015 and the text requires 1% tolerence. I have looked through all of my catalogs and the only polystyrene caps that are listed are values like: 100. 1100. 22000. etc... am I on a wild goose chase here.... could it be that the book has a misprint? Or is it my inexperience.

In the mean time Iam going to order some 0.015 polyester caps that are 2%. At 40 cents a peice it is worth a shot!

If I am unable to resolve this question would someone send me a schematic for an AF Filter whose componets are more common.. I would be happy to SASE.

I recently upgraded to Tech Plus and only need 13 WPM to pass my General. I am trying to make as many contacts as I can to build my code speed but my Kenwood TS 520S has no CW Filter and Kenwood no longer makes the part. As many of you know It is very rough to copy a weak signal in 9+db of noise on 80 meters!

Thank you,

Marty

>what
>has been your experience?
>
Hello John,

PLEASE don't try to modify the HW-16 for AGC! It's NOT a good idea! Here's why:

1) Performance Degradation: If there is more than one signal in the passband of a receiver that uses AGC, the receiver will try to adjust its gain to the sum of the total signal strengths. Since CW is on-off keying, the receiver gain will jump around all over the place. This makes the QRM appear much worse than it really is. With a really sharp IF filter that has excellent skirt selectivity, this is less of a problem, but the HW-16 has a 2 pole half lattice filter that has good "nose" (-6db) selectivity but only fair "skirt" (-60 db) selectivity. Using a fast attack slow decay system helps a little, but unless there is no QRM you'll find that the best reception is obtained with the AF

gain turned up high and the RF gain used for volume control.

Yes, many modern rigs don't let you turn off the AGC. I think that one of the reasons many new hams have trouble with CW on the air is the use of AGC in CW reception.

AGC also reduces the apparent selectivity of the receiver by adjusting the receiver gain as you tune through a signal. Since the HW-16 requires a separate VFO or crystals, (it's actually a transmitter and receiver in one box with a common power supply, not a "true" transceiver), this makes "spotting" harder.

2) Circuit complications - the HW-16 uses an ingenious T/R system that permits full break-in (real QSK). I believe that the HW-16 was the ONLY rig in its day to offer full QSK right out of the box, with no mods or accessories needed. Any AGC system would have to interface to this system so that the receiver gain would recover instantaneously between key-down intervals. Also, the HW-16 uses all sharp-cutoff tubes (6EW6s) in the RF and IF stages, rather than remote cutoff types that are more adaptable to AGC.

3) Audio AGC is not so hot - To echo W7EL, audio AGC suffers from many problems. The main one, I think, is that it's impossible to get the attack time to be fast enough to avoid pops when a strong signal comes into the passband. This is harder on the ears than no AGC at all.

4) There's a better way - To save your ears, just put a simple audio clipper on the output. A pair of silicon diodes connected in parallel (but of reverse polarity) across the audio output from the rig will clip the output to 0.7 volts peak. If that's not loud enough, just put another pair in series. For a fancier job, use a switch to select how many diode pairs are in use. A simple LC audio filter made with telephone toroids and capacitors, installed after the clipper, will help too. The clipper/filter unit is easily built into a small box external to the HW-16.

Good luck to both you and your son. The HW-16 is still a great rig, 31 years after its introduction. Email me for more info if needed.

The actual value of the caps is not nearly as important as them being closely
matched. Get a whole handful of loose tolerance caps and pick out the number
you need that are the closest in value. Rat Shack has a meter for about $80
that measures capacitance, or you can build an adapter and use a regular VOM.

By the way, just because it isn't an "official" TS-520S CW filter don't mean it
won't work in your rig. Look into putting some other filter in. Check with
Kenwood's tech guys for off-the-record suggestions. You might want to get a
brand new filter for, say, a TS-50S or something like that, or you might
salvage one from a dead rig or from somebody who only works phone and changes

the CW filter out for a narrow fone filter.

The reason you still ought to have IF filtering is that even though a signal might not be heard post-audio, if it is in the IF passband it will still pump the AGC. If you're gonna do serious CW, get the IF filter AND use an audio filter.

Give me a couple of days and I can post a jpg file of the National NCL2000 schematic. It uses a pair in paralell. It is a grid driven amp with the grids swamped with a 50 100 W resistor bank. The 50 Ohm resistor is made up of two banks of 180 Ohm 5 watt film resistor 7 in paralell to form one bank. The two banks are in series to give 50 Ohms. Each band is about 26 Ohms. Standard PI network. There is a time delay relay to keep the plate and screen voltage off the tubes until the filaments warm up. The time delay is about 60 seconds. This is very important. The tubes will work well at 6 meters. They are rated to 500 MHz. The NCL2000 runs the plate voltage at about 2700 volts at full power out and does about 1400 PEP on 10M.

The torroid can be found at Bytemark (www.bytemark.com). The T-157-6
cores are $3.50 US. As for the 3N140, Motorola has not made those in
several years. There might be some surplus parts houses that may still
have them. I would suggest using some of the 3SK series. Those can be
found at RF Parts. They may be able to help cross reference the 3N140
dual gate MOSFET for you.

Hope this helps

Regards
James

PS: yes it is hard at times to find small parts anymore.

Return loss is another way of describing SWR. The greater the return
loss the better. There is a relationsip to return loss and SWR. At
this time I can't exactly tell you the formula how to convert one tot
he other. I use the chart in the ARRL Handbook 1986 edition.
Essentially a return loss 0f 10dB is close to a SWR of 2:1 A return
los of 30 dB is slightly better than 1.07:1. In using Mimp, set the
return loss circle to 20 dB. If your match puts you anywhere inside
that circle you will have a SWR of better than 1.2:1. That will be a
good match. Mimp works well. I used on my senior project and the
amps worked well.

I have recently use a film from Techniks Inc. It is a film and not
paper. It called PNP Blue. I just took my artwork printed from a
inkjet printer and placed it on a copier. Put the film in the copier
feeder and then place the film on the copper board and ironed it on.
Peeled the film of and etched. Did 10 mill traces with 50x80 surface
mount components. Works great. The key to these types of processing
is the copper board should be clean and free of any dirt and
especially oils from fingers and handling. Clean the board just prior
to ironing on the film. Very important.

Regards
James

Sorry for more questions, but I need to change an MC-50 mike with a 5 pin connector to a 4 pin connector. How is the 4 pin connector wired for a TS-530S? If this isn't of interest to the ng, an email reply would be appreciated.
Thanks,
Brian

Hi there fellow confused designer!
Well, if I understand your question about the 20Db return loss, that
means that the filter matching circuit you have designed has a SWR of
about 1.3 to 1 which is a pretty good match.
If you were to substitute small piston trimmers or similar variable
caps in your circuit, you could efectivly tune the filter to an exact
match much the same way a final rf amplifier pi network matches an
antenna.
Good luck.....Mike Baker K0QZ/7

>disgrace that we have to pay for. We pay for calls to the Internet in
>England!!!!!!

First of all, you got the name wrong. Packet radio internet gateway
has traditionally been a message/e-mail gateway only. On the packet
radio side it has traditionally been AX.25, and it routes messages
back and forth to the Internet. What you want is a TCP/IP connection
over packet radio. It has been done in various areas.

>PLEASE NOTE:-If you have never heared of an packet radio internet
>gateway, DONT reply to me saying youve never heard of it, and its not
>possible, because I jolly well know it is possible, this would
>obviously be the first time you have heard of it, so DONT bother to

>welcome your input.

Well, you don't get to say the term right, so some people might get
confused.

>I need to know what equiptment I will need to do this, the cost, and
>if there are local gateways operating in the MHZ freq. range that will

Again, you didn't get the term right. What you need is a UHF or
higher frequency if you want to operate on amateur radio bands. And
just to be sure, check with your own country's band plan as I am not
familiar with yours.

>be able to cope with a high speed packet radio modem (56K + baud),
>in the NorthWest region of England. From reading stuff off the net it
>wont cost a fortune to implement all this. I apparently need a TNC
>(Terminal Node controller), radio, amplifier, and Antenna, and

There are no off the shelf TNC which will give your 56kbps air speed
(or more). There are packet modems which are in use by various
people, but not with a TNC. An example is the WA4DSY "GRAPES" modem,

to be used by the P.I. synchronous I/O card by the Ottawa group. By the way, speed is measured by bps (bits per second), baud is not used commonly anymore as it refers to the change of phase per second, which does not correspond to the speed issue.

>anything else you might think I should need. Read some info about JNOS
>too, presume its possible to run TCP/IP over that, with WIN95, and all
>the traditional internet application programs running all above that,
>FTP, email, Netscape browser etc etc etc. I hope to run all that
>little lot from a 486AMD5x86-P75 ,256K cache,16MB, WIN95, which will
>more than meet the needs of the Packet radio interface.

Although JNOS might run under Windows, I am not aware of JNOS having a socket link or a network interface presence to Windows (95 or not). In order to use "traditional" internet apps, you need to use a stack which has connection with Windows networking interface. FlexNet is the only software I am aware of which can do that. However, I am not aware of FlexNet supporting the 56kbps GRAPES or any high speed packet modem (yet), although they have a modular design which gives it a future possibility. The only other way to do it, which is the way our club (University of British Columbia Amateur Radio Society) has been doing, is to use Linux operating system, which has AX.25 driver for the P.I. card for the 56k link, and run this computer as a gateway. Then use a Windows computer connecting to this Linux gateway via a network connection (we use 10B2 ethernet). But you didn't mention you have another computer, which this needs. I am not sure how crazy your local packet group is, but it took us a long time and quite some money to build the system we have today. In order to have the connection with the user, (we are only doing a short hop point to point now), we are currently building the 56k as a repeater to be put somewhere high up on mountains. Stilll people with no line of sight to these repeaters will not connect as any reflections will distort the signals badly.

I am not sure if you have your licence yet, but may be that will be a first step. Or may be now you think paying your ISP isn't that bad an idea.

1880. 40 meter qrp kit

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-19 00:00:00 UTC
From: talbot@kmrmail.kmr.ll.mit.EDU
Message-ID: <3.0.16.19980219214430.35f7c970@kmrmail>
Source record: 86076

Scott,

I have built a White Mountain 40 and 20 meter SSB kit and have been pleased with the both of them. A write up was in a recent QST magazine.

There is an even more inexpensive QRP SSB kit available from Dan's Small Parts.

I do believe both are on the web.

George V73GT

PS. I leave on vacation tomorrow so I will be gone for about 10 days.

Date: Tue, 17 Feb 1998 22:36:37 -0500
From: sgordon1@ibm.net
Subject: Wtb: QRP Kit or Plans

Looking for recommendations on a 20m or 40m Qrp tranceiver kit or plans to build one for QRP work. Mostly do ssb work but find myseld on cw more often when working qrp.

Thanks
Scott

1) Using a receiver to monitor frequency while grinding is fact. It's what commercial manufacturers have done as a rough monitor of their processing. The freq seen this way is affected by the lapping machine, the pressure and the density of the abrasive slurry, so some empirical correction factors need to be made.

2) commercial Xtal lapping machines have planetary "Spirograph" plates with holes to take the quartz. Abrasive slurry is added and a weighted plate sits on top to provide controlled pressure.

3) Xtal manufacturers have proprietary recipes for choosing face profiling, disc diameters and deposited electrode dimensions and thicknesses that they've found minimise spurious modes, favour specific overtones etc etc. Some of these "designs" are good for specific purposes only over surprisingly small frequency ranges.

4) Cleanliness is important, so is getting the faces parallel. A very high degree of surface smoothness is necessary to get decent activity. Microscopic scores in the surface are the seeds of what you could think of as wounds in the crystal lattice. Good polishing, often finished by hand with an amazingly fine abrasive is used for xtals that need to go in low phase noise oscillators.

5) Deposited electrodes make much tighter coupling with the quartz resonator, and the size of the elements is a lot smaller in modern xtals, so the circuits that worked well tith the old FT243 era xtals, and what works with current types are quite different. few modern devices would survive the levels that some old circuits used to run at.

I've been collecting xtals for 25 years, I must have a few thousand. I've been building my own filters for some time, see Wes Hayward's "Intro to RF design" for a good text with free software... I've also been professionally involved in special low noise xtal oscillator development.

I built one of these redios from dans small parts and it was NOT for
beginners.

I need assistance getting it working, but the RADIO is great.

If you want low cost QRP, i recomend the Pixie-2 or the smite from the
Knightlights.

Chip

If you intend to receive strong signals use an active antenna like
DRESSLER ARA2000 or only its amplifier part named EWP2000 (a low-noise amp
rated from ca. 50 MHz up to 2000MHz with max. noise about 3dB) + a homebrew
little logperiodic mounted in the focal point of a 60-90 cm parabolic focal
dish.

So you can cover the whole speectrum 50 - 2000 MHz. It' s fine with AR8000.

An other solution , search with Altavista on the net , with keywords like
"meteorological satellite" or "weather satellite" and see the results. There
are a lot of companies selling low-noise amps only for the Inmarsat or
Meteosat frequency range.

Or see the page : http://ourworld.compuserve.com/homepages/HFFAX

Hope it ' ll help you.

I have a repeater that covers much of the back country that does not have cell coverage. However, there is no landline to the mountain top where the repeater is located.

Cell company will donate cell service for outgoing emergency calls only.

Problem: Has anyone ever interfaced a Motorola bag phone to an autopatch. Just thought I'd ask so that I don't have to reinvent the wheel.

Transformers are communtative as a rule.
I often do that.

good luck.

Hello--
You can use two identical transformers connected back to back
(i.e., 117V:6.3V to 6.3V:117V) to get an isolated 117-volt source rated
TO THE SECONDARY VA-- that is, use a 6.3V/6A transformer, and you only
get approx. 36VA of isolated second-transformer "primary" power. There's
no magnetic free lunch<g>.

Likewise, you could use a 117:6.3V transformer to drive a 6.3V; 234V
dual-primary transformer to create a "centertapped" secondary AC source
of 117-0-117 volts.

HAMFEST March 8, 1998 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB & SUFFOLK COUNTY RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST-COMPUTER SHOW - MARCH 8, 1998

LINDENHURST, LI - NY

On March 8, 1998 the Great South Bay Amateur Radio Club & Suffolk County Radio Club will again sponsor an indoor Hamfest-Computer Show. The location Will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.

This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and accessories, software, books, technical manuals, ARRL information, Amateur Radio License Exams and information. Door Prizes. General admission is $ 6.00. $5.00 with coupon. (Coupons will be available at the door.)

ARRL VE - 12:00 NOON
For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam session. 1998 ARRL/VEC fee is $ 6.35, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

For vendor and additional information pleas contact, Tom Favilla N2MIG at (516)957-5985, during EVENING HOURS (7PM-10PM), or info@gsbarc.org
NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available. Tables are 2.5ft x 6ft.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is available during the club 2-meter info net:
GSBARC-Monday at 7:00 PM on the W2GSB repeater, 146.685 -600 4Z(136.5)PL.
SCRC - Wednesday at 8:00 PM on the W2DQ repeater, 145.210 -600 4Z(136.5)PL .

I am using an old "CB" SWR meter in the 2 meter amateur band. It's
about 20 years old and I believe it was US manufactured. A long
time ago I took the cover off and it appeared to be of excellent
quality -- it even used Glyptol (sp?) on screws and nuts!

I have used it for power output levels up to 25 watts. I would be
nervous about the results with more power -- probably too much of
the stuff floating over the outside, and in-and-about the exposed
meter movement -- causing bizarre results.

I like the suggestion above about using it (testing it) both
'forwards' and 'backwards'. I hadn't thought about doing that.

Since you are truly looking for 'comparative' results with an SWR
meter -- i.e.,
"Is the SWR now better or worse than before I made the modification" ,
I think you should do fine.

Ask Mortorola,

Some cellular phone have pins on the bottom that cover off hook, analog in/out
and dialing.

See if there is a hands free kit for the phone.

A bett way to go might be a portable, and an external amplifer.

BTW, the FCC requires that ALL cell phones donate 911 time.

You done even need an ativated phone.

How about three low voltage transformers. Take 120 to ~6V on one, use it to power the 6 volt windings of the other two in parallel, and tie their 120 volt outputs in series. Result: 240 VCT. Of course, we're getting pretty complicated here, but if your philosophy is to use what's in the junk box ...

(I have a DX-35 using two power transformers (one just for the filament of one tube.) and a homebrew XMTR from the '57 handbook with two power transformers in parallel plus three chokes in series/parallel to get the necessary henries. Guess I got a little carried away.)

Hi Jim, OM,

The XMTR on two board strips was written up in the Dec 1946 issue of QST. It was featured in many of the "How To" ARRL magazines for the next decade or so. I know, because I built one using the 1954 issue of How to Become a Radio Amateur. I still have and use that rig. It is a tri-tet oscillator and used a 6V6.

Good hunting,

Don, W6JL

Sure, John. Look at Ramsey's 2M kits. They are cheap, and you have a decent PA and Osc onboard. Just don't use any of the modulation circuitry. Or you could go MCW with an audio osc that is fed into the original audio stage.

So much for the transmitter. The RX is a bit more involved, but the Ramsey boards have lots of room for radical mods.

Maybe they would send you a manual or a parts-stuffing diagram and schematic, and you can decide on the issue.

By the way, all the Ramsey kits I have ever built worked first time. They are the no-brainers of the kit world, with a few exceptions, and make great first-time kits. There is usually lots of room for mods... I turned a DC into a superhet once, on the same board. The only beef I have with them is their control pots are pretty shoddy sometimes, and especially for those used for varactor tuning, you should replace them with a nicer unit once you have it working. I would really like to see more of their kits hanging on the racks at RS and the local Ham shop. Nothing like a decent kit to get a new ham into homebrewing.

Brian, I didn't see a callsign, so I will assume you are new to radio design. I hope I don't seem to be talking down to you if you have more technical knowledge than what I assume you have.

Are you using a decent ground and antenna? Crystal sets need both. You can make, say, a 20 foot antenna VERY effective by loading it with a coil wound on a ferrite rod from an old junked AM radio. The ferrite rod is a black rod or bar about 4 inches long and 1/2" wide and it will have a coil of fine wire wound around it. This is the antenna of most AM sets. Without some loading, your antenna will hardly hear anything unless it is at least 30 feet long. The longer the better... at 1000 KHz a 1/4 wave antenna is 234 feet long!

You can even use the antenna and tuning capacitor "as is" from a dead radio as antenna and input tank. Just hook up your Germanium diode and high-impedence earphone, ground one end of the loopstick, and you are in business. If it doesn't work, switch your connections around... there are only just so many ways you can connect 4 components in a circuit.

A cold water pipe is only a half-assed ground and sometimes is not a ground at all due to the common use of plastic pipe for parts of the system. Just because you have metal pipe where you connect does not mean it is metal all the

way to ground.

Best ground for your application is an 8 foot ground rod from the hardware store. It should be copper-clad steel. Drive it into the ground and clamp your ground wire to it with a hose-clamp for temporary use. Not as effective, but a lot cheaper, is to dig a trench 2 or 3 feet deep and as long as you can manage, at least 10 feet, and bury BARE (not enameled) copper wire in it with the end running to your set. The more wrire you dump in the trench, the better. Just wad it up down there. The bottom of you trench should be down to moist earth. Cover it back up. Now you have a decent ground roughly 2/3 as effective as your 8 foot rod.

Make sure you are using a Germanium doide and not silicon. 1N34 is one common one that I am sure Rat Shack carries. Try turning it around also...and change it out for another one if there is doubt that it is working.

Is the wire of your coil insulated? You can't use bare wire. It should be at least enamel coated. Make sure you have the insulation sanded off properly where the slider makes contact, but not so the turns are shorted out against one another. 100 turns on a tolet paper tube is about right. I would have reccomended about 120 or 150 and maybe a 365 pf cap to start with.

All of your capacitance does not have to be in one capacitor. You can connect 2 or more caps in PARALLEL that is side by side in a circuit with their top and bottom connections tied together and treat this as a single cap in the circuit. The advantages are many... you can replace part of the capacitance with fixed value caps to decrease the range that the variable cap tunes.. No this is not bad... this can be good. If 1/8 turn of the knob takes you throu 100 KHz or so, you will find the tuning too touchy. Also, you can use a big, say 365 pf cap for main tuning and a smaller one, about 25 pf for fine tuning. You incrrease capacitance by putting them in parallel... by adding their values. You can limit total capacitance by putting them in series, but we won't get into that.

You will be able to hear local broadcast stations if you have everything working right, wo you don't need your transmitter to test your receiver. One thing at a time. The most basic rule of electronics troubleshooting is "divide and conquer". Isolate complex systems into its subsystems, subsystems into circuit blocks, circuit blocks into components, and through process of elimination narrow down the area where the problem could be. Checking an untried receiver with an untried transmitter is going about it wrong and introducing more uncertainty rather than reducing it.

Now... on the subject of your transmitter, check it out with a store bought receiver that you know works. Make sure you have a proper antenna, I think 3 meters is the maximum allowed, and that you have a proper ground as with the receiver.

The transistors in your transmitter are probably cheapies... I bet they are 2N2222s or 2N2222As or something like that. You don't have to worry about blowing one. If you touch the transmitter antenna to the RX antenna, or better yet just put them a fraction of an inch apart, you had BETTER hear SOMETHING in the phone. If the transmitter subsequently no longer can be heard on a nearby

storeought radio then your final "went away" due to an obscene impedence mismatch. This is not likely, but if it does, replace the final, i.e. the transistor closest to the antenna in the circuit.

How about your earphone? You MUST use a high-impedence earphone... the old crystal earphone type works FB. the Impedence of the earphone MUST BE AT LEAST several hundred ohms and should be a couple thousand generally. You MIGHT be able to use what is called an audio transformer to match the circuit to a low impedence earphone... one side of the transformer is high impedence... around 2000 ohms... connect that winding to there the earphone would normally connect. The other winding is low impedence, typically 8 ohms. Connect your low impedence earphone to that. This is not precisely correct, but a good way of looking at the situation is that a low impedence load on the circuit like a 8 ohm earphone "sucks all the signal" out of the tuned circuit so the signal level isn't high enough to register. Don't quote me in class!

Radio Shack also has an audio amplifier and speaker in one box, and they might also have it as a kit. This device is useful for poking around in a circuit looking for an audio signal. The input probably has an impedence of a few hindred ohms and you should hear something with the input connected to where the phone should go.

Other than that, all I can suggest is to swap leads around, change components out, wind a new coil, try hooking things up a little differently, ec.

Hi,
Anyone interested in trying out a beta version of a windows 3.1
application to control a TS440 (or compatible) from windows 3.1?

It allows split freq, two vfo's and channel selecting.

I will respond to the first 20 persons.

The program is small and supports com1-4 and is mouse driven, No
keyboard entries.

Please respond to surfer@snet.net
I will be releasing the first beta version in about 2-3 weeks.

Thanks
Stan NI1Z

hadn't heard that. I get 'em free by removing them (with a butter knife to compress the spring) from old film packs; they've got enough power for shelf life and full flash on all frames, so usually they've got plenty of juice left when they're trashed. My intercom runs off a pair of these. (And the rest of the ilm pack can become an attractive frame, just add Martha Stewart (TM)! :-) Probably won't supply the quantity you need unless you go to a convention where lots of folks are shooting Polaroid (which I did as a kid).

> Where do you get this free in the US idea?

It's hard to find a major ISP in the States that doesn't support unlimited connect time for a flat rate these days. This includes some of the "big ones" with millions of subscribers. Whether this pricing model is going to be viable in the long run is a matter of some debate, but the trend has been clear for quite awhile now.

Local telephone companies don't care if you camp out on the line 24 hours a day, as long as you pay the US $20/month service charge. (This is true of both basic and ISDN service in my area, although roosting on an ISDN account will quickly send you to the poorhouse in ISP charges.)

It's safe to say that "free" local calls are subsidized by long-distance rates to some extent, although to be honest the average US citizen has little grounds for complaint about high long-distance rates either.

IMHO the U.K. and Europe have always been behind the times in matters technological. Heck, I've been involved with personal-computer software projects that had to support cassette tape drives as late as 1988, just for the European market. Get with the program, you guys! :)

From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <34EE5D6A.267E@pop.removethistomailme.net>
Source record: 85913

HP 141T configuration for sale w/the following accessories:

- HP141T analog storage mainframe
- HP8552B IF section
- HP8554B RF section (UHF coverage to 1250 MHz)
- HP8553B HF section (high-resolution coverage to 110 MHz)
- HP8556A LF section (high-resolution coverage to 300 kHz w/built-in tracking generator)
- All operating and service manuals
- Spare storage CRT in original sealed HP carton

All units are in good shape electrically and cosmetically, apart from minor paint scratches on 8552B and 141T panels. .JPG photos available on request.

Asking $1500 plus shipping from Austin, Texas. Unit available in Austin for inspection by interested parties.

From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <34EE649C.66CF@pop.removethistomailme.net>
Source record: 85914

FS: HP 8554L spectrum analyzer plugin for use with 141T mainframe (not included), 500 kHz-1250 MHz coverage. This unit works perfectly, but is around 8/10 cosmetically with a few areas of paint rubbed off where old labels were removed.

The 8554L plugin is equivalent to the 8554B, but with frequency coverage extending to 500 kHz instead of 100 kHz for the 8554B. If you're looking for an 8554B and don't need the bottom 400 kHz of calibrated coverage, this would be a good, economical alternative.

Asking $250, seller pays shipping from Austin, TX. .JPG available on request.

Correct me guys if I am wrong here, but I believe he can use an ordinary 115 VAC type transformer than has a secondary of 50v or so, but hooked up in reverse so as to apply the incoming to the "original secondary" and retrieving the output voltage on the "original primary". The cost would be low. The only other consideration would be exceeding the design voltage on the transformer by a small margin..I don't think it would be a problem in practice....

Greetings Jonny...

Here are a couple of web sights to check. First is the ARRL. The
second is the Central States VHF Society.

ARRL: www.arrl.org
CSVHFS: www.csvhfs.org

There are many books also available that give detailed constructions
on the building of a L-Band antenna. Also you might try a search for the
Radio Society of Great Britian(sp) (RSGB).

Hope this helps...

Greetings Scott...

Check out Oak Hills Research. I believe there url is www.ohr.com.
They have very good kits for the two bands you mention. Also NN1G puts
out the Green Mountain kits that are very good also. I do not know what
NN1G's URL listing is. You could also check into the QRP-L reflector for
that information. Send your mesage to QRP-L@lehigh.edu. If you are not
a member of QRP-L you can join the rest of us by sending a message to
listserve@lehigh.edu and leave the subject blank. In the body of the
message put subscribe first name last name call...

Wouldn't a safer approach be to use two transformers socondary-to-secondary,
the first one say, 110/12V and the other 220/12V? Losses would be more than
negligible, parhaps, but nothing would be exceeding design parameters. If the
bulk is not a problem, I think this is the way to go. Mouser has reasonable
220v step-down XFMRs.

BTW, this is a technique recommended to me for isolation when I was building my
first tube project... originally I thought it would be clever to just rectify
and filter 110AC line juice for the plates in a receiver. I didn't know this
had been tried by some noble, brave, and deceased experimenters of bygone days.

Hello Bob, the problem is that the person who posted the query in the UK. Internet Gateways (and phone patches) are ILLEGAL under the UK license conditions, and with a few rare exceptions the UK packet network still mainly runs at 1200, with occasional 9600 ports, plus the odd once-in-a blue-moon high speed microwave band port. The information that he has been given is correct, specifically for the UK.

O/: >
O/:
O/:
O/:
O/: 1) Using a receiver to monitor frequency while grinding is
fact. It's
O/: what commercial manufacturers have done as a rough monitor of
their
O/: processing. The freq seen this way is affected by the lapping
machine,
O/: the pressure and the density of the abrasive slurry, so some
empirical
O/: correction factors need to be made.
O/:
O/: 2) commercial Xtal lapping machines have planetary
"Spirograph" plates
O/: with holes to take the quartz. Abrasive slurry is added and a
weighted
O/: plate sits on top to provide controlled pressure.
O/:
O/: 3) Xtal manufacturers have proprietary recipes for choosing
face
O/: profiling, disc diameters and deposited electrode dimensions and
O/: thicknesses that they've found minimise spurious modes, favour
specific
O/: overtones etc etc. Some of these "designs" are good for specific
O/: purposes only over surprisingly small frequency ranges.
O/:
O/: 4) Cleanliness is important, so is getting the faces parallel.
A very

O/: high degree of surface smoothness is necessary to get decent
activity.
O/: Microscopic scores in the surface are the seeds of what you could
think
O/: of as wounds in the crystal lattice. Good polishing, often
finished by
O/: hand with an amazingly fine abrasive is used for xtals that need
to go
O/: in low phase noise oscillators.
O/:
O/: 5) Deposited electrodes make much tighter coupling with the
quartz
O/: resonator, and the size of the elements is a lot smaller in modern
O/: xtals, so the circuits that worked well tith the old FT243 era
O/: xtals, and what works with current types are quite different. few
modern
O/: devices would survive the levels that some old circuits used to
run at.
O/:
O/:
O/: I've been collecting xtals for 25 years, I must have a few
O/: thousand. I've been building my own filters for some time, see Wes
O/: Hayward's "Intro to RF design" for a good text with free
software...
O/: I've also been professionally involved in special low noise xtal
O/: oscillator development.

I would suggest contacting one of the local cell phone dealers and ask them
for a fax machine interface.
This is an adapter that will allow you to plug your repeater patch directly
into a normal telco rj-11
jack.

Well, not exactly the poor house, but unlimited ISDN here in St. Louis
would cost about $250 a month. That's a 2B+D line ($100) and ISP
charges ($150).

This is very strange! Strange indeed. I asked in here (once upon a time) if there was any interest in a "tube manual" or tube data web page. I offered to construct such a set of web pages on condition there would be interested users. I was hooted right off the ng and didn't return for several months. Obviously the users on this ng will not have any tubes or info. You should go to the next ham radio swap n shop and buy a few tube manuals for a bout 25 cents each. Then you'll have the same info I have and can forget about being dumped on by this group.

Good luck and enjoy the tube projects. Not because they are really practical... just because they are *fun*.

No problem. Just change the conversion oscillator crystal in the
transverter so that you're tranlating 27 MHz up to 2m instead of
28 MHz.

The problem comes in the fact that the CB is channelized. You
need to fix that by doing a "slider" mod to it. And it doesn't have
the tuning range to cover the 2m SSB frequency range, so you
need to do the "freeband" mod to it. After you've done those mods,
you can't use it for CB anymore. But that's Ok since you want to pull
the PA out of it and strap the driver to the output so the power
will be low enough for the transverter input (about 5 mW) anyway.

This is actually a fairly practical way to put an old SSB CB
to use in amateur radio. But since you're outbanding it anyway,
you might as well do a CB->10m conversion on it and then you
don't have to buy a new crystal for the transverter.

I did this to an old Midland 23 ch SSB CB. I changed the hetrodyne
crystal to put it on 10m, and I had to add a couple of extra switches
to outband it, and modified the RIT to work as a slider in transmit. It
actually works pretty well, but I have to use a chart to figure out what
frequency I'm really on. (Not bad for a free radio, though.)

Now don't expect world beating performance. The CB isn't the
equal of a good HF rig as far as selectivity is concerned, though
sensitivity is fine, and transmit is pretty clean. The tuning is
complicated by having to step a channel and swing the RIT, but
it'll do for casual 2m SSB operation. And if you rig it so you can
switch the PA in and out, you can use it on 10m too. I did that,
and bumped the output up to 20 watts PEP on 10m as well.
I used it in the truck during the last sunspot peak and worked
the world with it. (Of course I have an IC-706 in the new truck,
so the old Midland was retired to the junkbox.)

Changing a transverter IF from 10 to 11 meters (especially if you are building it) is not difficult. The LO frequency (crystal?) must be changed and multipliers retuned. This MAY require a small change in tuned circuit values - depends on the design/tuning range. The 10/11 meter tuned circuits in the IF will need similar retuning....Voila!

> with a 470uf cap. but I cant seem to get anything out of it.

This might be too obvious -- but try it anyway.

You need to remove the insulating enamel from the magnet wire
in the area where the wiper contacts the coil. Some fine-grit
sandpaper will work, or you can carefully scrape off the enamel
with a small knife. Also, verify that you have a clean surface
on the wiper to get a good metal-to-metal contact. You do not
need much pressure, but a clean contact is vital.

If the crystal (diode, whatever) is good, you should hear
SOMETHING off this style of receiver, even if it's only
spark plug noise from a nearby automobile or motorcycle.

You might verify that the tuning capacitor is not shorted, and that
all the connections are good -- these are other possible
trouble spots. I am VERY guilty of an occasional bad solder
joint or dirty connection.

Hi Mark

You could get yourself an old FT-290, that will give you FM/CW/SSB on 2m
pretty cheaply.

You will also probably find that a few SSB CBs have been modded to over-tune
past 28MHz anyway (the high-high-super-high channels :o))

I will be pleased to see it!
Problem is that it is almost impossible to find extensive valve data and
curves. I have only ARRL handbook anno 1948 and 49 for old valves, it is
not satisfactory for calculations to study and compare what was possible
to achieve using valves like 6D6/6C6 compared to 6BZ6/6DA6

>be very cheap), to link to the NET.

And it won't be Gatesy who'll be paying for it.

>I too think for better communications, much improved speeds and
>services, it would be better to connect to the NET NOT via a modem and
>PHONE line, and to dispense with that archic part of the link
>altogther. So I am not the only one who thinks the modem phone link is
>a bad idea.

Then try getting B.T. and the other telecomms sharks
to make ISDN more attractive to you and me, for a
start. You might also suggest to the authorities that
some of these bloody amateurs be moved out of the
VHF/UHF/SHF spectrum they occupy* to make way for the
sort of free, high-speed Internet access you crave.

* ...or don't occupy, depending on your line of sight.

What I'm curious about is what the UK third-party traffic rules have to say about this. This sort of use is clearly beyond the scope of "transmissions of a technical nature whose importance does not justify the use of the public telecommunications infrastructure" (paraphrase of the Canadian regulations). What you propose would certainly be illegal in Canada.

Rather than trying to do everything in software why not try a mechanical
solution? Obtain a long, narrow piece of metal or a meter (yard) stick
with a known, accurate right angle at the end. Place the end in the belly
of the dish with the narrow dimension towards the center. If two "sticks"
are used the center of each will cross at the focus. If one is used,
then the center of various positions will locate a single point which again
is the focus. It seems reasonable that this should work for both circular
and off center focused dishes but the latter is going to be far more
difficult to do. Cliff Buttschardt K7RR

> could it be that the book has a misprint? Or is it my inexperience.

The answer here is that the units of capacitance are different in the
schematic and in your catalogs. .015 microfarad is equal to
15000picofarad. Look for a polystyrene cap with 15000pF value.

Another option is to use .01uF (10000pF) caps and re-calculate the
resistors involved to yield the same R*C product.

Good luck.

>Packet radio interface.

First, all the packet gateways I know about are Amateur Radio packet
gateways, so to gain access, you will need an Amateur Radio license.
Second, not all the traffic carried on the Internet is permissible under
an Amateur Radio license in many countries, including, I think, the UK.

A group of BC Amateurs has designed and built a 56 K radio/modem currently
used to connect a number of sites together, including a link to the
Internet. I understand they're presently designing a new one that will
basically have two connections plus power - an ethernet connector and an
antenna connection.

They're presently using the 430-440 MHz band with about 85-100 KHz
bandwidth, although the goal down the road is to go up in frequency to

just under 6 GHz so that the bandwidth for a T1 connection will be available.

So, in conclusion, if I were you, I'd find a knowledgable person at the RSGB who can tell you what is possible under UK rules. They would also be able to steer you to active packet people in the UK.

Hi, "newbie" --

It sounds like you may be new to the "newsgroup thing," and aren't yet conversant with the subject of spambots. Spambots are automated newsgroup posters which place messages such as the ones you've replied to on literally tens of thousands of newsgroups, without any intervention or supervision from the people responsible for the spam.

Replying to spam messages in newsgroups does nothing but compound the waste of bandwidth and server space caused by the spam in the first place. The originators of the spam do not look in the thousands of individual newsgroups for any replies to their spam, and will thus never see your indignant reply... but the rest of us have no choice.

Further, many of us use news servers such as Super Zippo (http://www.zippo.com) which implement automatic spam filtering based on a wide variety of criteria. The idea to keep messages with subject lines or contents like "MAKE MONEY FA$T", and so on from ever appearing in their customers' view of the newsgroups. This technology works very well, and is a major selling point for the news services that offer it. Unfortunately, when someone like yourself replies to a spam post that is visible on *your* news server, your reply has the effect of making the spam visible to the rest of us for the first time -- effectively generating spam we otherwise would never have seen in the first place. This happens because many of the common spam filters don't reject replies, only original messages.

So in short, please knock off the replies to spammers. Your audience for such replies is limited to everybody in the world *except* the spammers themselves, and believe me, everybody else already agrees with you.

FS/FT: Commercial 5GHz Digital Microwave radios

I have nice pair of commercial spread spectrum digital microwave radios.
They are made by CYLINK, model FT1, with the following major specs:

Frequency 5.725 to 5.850 GHz (cover ham band)
Freq step 5 to 10 MHz
System Gain 110 dB
Tx Output power 30.5 dBm Min
Rx Noise Figure 5.5 dB Max
RF interface N Connector
Voltage 110 V
Dimensions 5.25 x 17 x 15 in
Weight 39 lb.

These were pulled from service, only few years old, in excellent
shape, with manual.

Use for a commercial microwave link project, or for ham use
on the 5.650 - 5.925 GHz ham band.

These new sell for over $8K each, will sell or trade to best
reasonable offer.

I didn't realize this might be the hangup... they also might be listed in some
UK catalogs as 15 nf, I believe, and who knows, maybe US too.

I just looked in my capacitor boxes... I have a couple of .015 caps and from
hthe cryptic notes in the bottom of the tray compartment they are either from
Mouser or All Electronics. I guess I was or still am gonna build the same
filter. I use .022 caps mostly for this circuit.

Rat Shack has .022 poly caps.

ACTFIL.EXE is a program that was on the 96 ARRL Handbook freebie disk. It
calculates the cap and R values for a standard op amp audio filter whose
schematic is in the book. I seem to recall you can pick your capacitor value
with the program. Maybe it can be found at the ARRL website. Anyway, you might
want a change of bandwidth or center frequency.

Sounds like a job for a simple external converter. You just need to bypass the finals or better yet reduce the drive, build a 193 MHz oscillator and mixer, a pre-amp for receive, and a couple two or three RF output stages. You can either jump the PTT line out to the converter to handle T/R or use RF sense T/R. Or you could go the other way and use a 247 MHz oscillator. Same difference... but the lower freq might be easier to cobble together. Keep all component leads SHORT.Make sure you have adequate output filtering.

Then again, why not just build the whole 220 MHz rig so you don't have to work around the funky channel spacing of the CB?

Also... remember that CB is not FM. This approach will not allow easy implementation of either CW or FM, though you will have AM and AM SSB.

Have for sale two Harris RF-230 SSB transceivers, one matching power
supply, two Newmar 35 Amp supplies, a large stock of spare PCB's
for the Harris rigs, Harrris RF-231 coupler,one TI-3000
Transceiver/coupler.
Will sell as lot for $1000 or trade for other gear?
73,

Source record: 85956

At least twenty years ago, there was an article about this in WST. It was in the days of "use it or lose it". Someone took a tube CB set, ripped out the transmitter, and put in a new 220MHz transmitter. They added a converter ahead of the existing CB receiver.

More recently, there was an article in QST about adding a transverter to a 49MHz walkie talkie to turn it into a 220MHz lunchbox type portable.

220MHz is a long way from 27MHz, so there really isn't any way of changing some coils and moving the CB set to 220MHz.

>is it any available software or other calculations for deciding the
>optimum focal points for offset feeding a standard dish?
>f/D=0.35 D=2'

If by "standard dish" you mean a parabolic dish, there is only one
focal point, dictated by dish geometry, and it is the optimum feed
position. Any other point will compromise dish gain and off-axis
behavior. In the case of a f/D=0.35 and a 2 ft diameter, the optimum
feedpoint is on axis at a distance of 8.4 inches from the dish.

Dishes designed for offset feed are complex hyperbolic shapes,
though oval hyperbolic dishes can be approximated as complex
sections of two parabolas. Unless you know the generator parameters
for the surface geometry, the best way to determine the optimum
feedpoint is by experiment.

There is a program which may be useful. It is called HDLANT21 and
is available from the ARRL website at http://www.arrl.org/qexfiles/
It allows you to design horns, dishes, and lenses (HDL). It has a
section for calculating offset feeds for oval hyperbolic dishes.

I took the time to read Fisher's vitriolic little webpage and have confirmed what I always thought, the man is definitely not playing with a full deck.

Yes, his credentials were not renewed. He was not fired as he states. He, from the outset, trys to throw his "weight" around by threatening to go and "cry" to the FCC. you must restore FORTHWITH he states....and then..states he is being discriminated against.

The ARRL response cites factors as to non renewal and the very 1st reason is exactly why this started. By Fisher's own admission, he has not administered a VE session in the specified timeframe. According to Part 97.525

No VEC may accredit a person as a VE if the person does not meet minimum VE statutory qualifications or minimum qualifications as prescribed by this part

Burt's response is then to argue that he was "fired" for no apparent reason, yet he conveniently forgets that in another paragraph her mentions that there were others that supposedly have failed to meet the minimum qualification. In fact, this is the paragraph where he does admit his failure by lying..I quote

Further, I know several VE's that have never been active in giving a test (as I have) that have not lost their status as a VE examiner"

If you'll remember the 1st go around, Fisher admitted to not having given a test in over a year, so he is blatantly (1) lying about and (2) attempting his little boy tantrums but crying that "other guys were doing it tooooo!!!"

Fisher then continues his tirade with threats to write his Congressman concerning amateur spectrum. In fact he is really threatening to stoop to blackmail to get his VE status restored.. I quote " I suggest you do not motivate me to do as I might wish. I am willing to let sleeping dogs lie, just restore my VE status.

If you do so, this matter ends, quietly. If not, neither of us can be sure what is at the end of the road."

What is also very interesting is now Fisher claims to be a member of a minority. My question is exactly what minority is that?? Obvious he's not black, Latino, Asian, most definitely he's not a woman, although he has a tendency to cry and whine like some. In fact, he claims

discrimination on this basis. He further claims to have done quite well on Wall Street and therefore will bring his considerable financial might to bear with legal action.

Words speak very loudly here and the words from Fisher show a total lack of any sanity. Normally I don't promote websites but this you have to see. A man reduced to fabrications and outright lies to massage an obvious bruised ego.

I can see why the people of Packard Bell are paying him no mind as well.

Get the full story on Burt Fisher..check out Dejanews to see just what type of man is teaching children in Cape Cod schools

Did you know that they're lead-acid and can be recharged? I've measured them at 70 mA-h at 40 mA, and charge them from a 7.4 volt source with series 10 ohm resistor. (It would be a sensible precaution to wear safety glasses and put the battery in a sturdy container when doing experiments like this.) I haven't cycled one a lot of times to see how many cycles are possible, but there's no major degradation after a few.

You can get some pretty impressive peak currents out of these, a neat feature for some applications. But it also means you can start fires with 'em if you're careless.

Nope, you can't do that with a balun. You can make a conventional transformer
serve as a balun, but the bandwidth will be limited. Voltage baluns exploit
transmission line behavior, and thus are limited to the ratios available from
transmission lines. OTOH, they work over a wide bandwidth while conventional
transformers won't.

Yipe! Try a 470 uuf (pf) capacitor. 470 uf is *way* too big to resonate your
coil in the BC band. Might make a good power supply filter cap though.

Also, make sure the turns of your coil aren't shorting to each other.
You want to remove the insulation only from the *top* of the turns
so you can tap it. There should be no turn to turn contact.

And you need a *high* impedance headphone. Ordinary stereo
headsets won't work. They'll load the output too much.

Another suggestion. Get some aluminum tape and put squares of aluminum at a variety of places scattered around the inside surface of the dish. Take the dish outside on a sunny day and point it at the sun. Each of the little aluminum squares should act like a mirror and all the reflected rays will meet at a point above the dish. That is your focus. Measure the distance from the bottom of the dish to the focus so you know where to put your feed later.

I haven't tried this, but it should work...

VALVES and SURPLUS AMATEUR RADIO ITEMS from Bill Jarvis, gm8apx,
6 Peggy's Mill Rd, Edinburgh, EH4 6JY.

-PRIVATE- disposal - not a business! Please READ before enquiring!
Thanks -

VALVES/TUBES will be tested for at least 80% rated mA/V just before
packing. NOT SUITABLE FOR AUDIOPHILES OR COLLECTORS! (Condition and
history uncertain.)

Please OFFER for any ITEM or LIST OF ITEMS. Include enough for packing,
and Surface or Air Mail; also Insurance against loss or damage in
transit if you require it.

SWAPS welcome eg slide rules, advertising gadgets, charts, documents,
books (pre '60) - anything small, light interesting, to do with valve
electronics. 4 or 6 V magic eye wanted just now; also circuits of
reflex L/M Bands AM Receivers.

SORRY ! No guarantees, NO "URGENT" handling. I prefer to discuss offers
using email but phone/fax/message recorder number, during normal UK
office hours (9 to 5 Mon to Fri) is [0]131 336 4502. It's a private
dwelling so please DON'T wake us during the dark hours!

ITEMS OTHER THAN VALVES

FET MULTIMETER for parts or repair; needs matched FETs and probably more. Was Altai top-of-range analogue but under-protected...

Early palmtop computer w/Basic: Sharp PC1500; WITH Tech Ref Manual and 2 books of inside info (machine code tricks etc) (in German). "Defaced" with engraved notes (eg ASCII values) on keyboard. Missing attachments: Cassette interface and 4-colour "pocket" printer.

1947 ROVER 14 RADIATOR CAP, Desmo, customised with slightly (!) slver-plated brass Fox Terrier for dog-and-car enthusiast. Must be unique.

RED (not repsrayed) GPO Telephone type 706F, working w. original curly red plastic handset flex, and (white) skirting-board junction box and flex.

2 DOCUMENT EMBOSSERS, obligatory for (ceased trading) Limited Companies. Dies could be changed.

2 5 inch disk filing boxes, clear smoky brown tops, with locks and keys.

78 rpm wind-up portable gramophone; black leatherette cabinet in moderate condition; plays well (1 side on 1 full wind).

EARLY BAKELITE tabletop MARCONIPHONE T84B transistor radio; some signs of life on all bands so maybe not much wrong. Released July-Aug 1960. Needs one 9V PP10. Electrically like Ferguson 626BT and HMV 1421. WITH service data. 9 pnp transistors of the OC... range. Cabinet has been "smeared" with pale blue paint!...

"889" Chinese 20 to 49.99 MHz tank transceiver (synthesised)(requires 24 V supply, low R loudspeaker, mic - 50 kohm seems to work FB, aerial with BNC connection. No documents, but easy to connect up and get on air. Seems perfect but for 1 inch-ish dent top centre front.)

AVO LCR Bridge; looks well used but seems to be working correctly.

4 track 4 speed Philips Tape Recorder, lacking microphone. Seems working 100%; good cosmetically.

VERSATILE PARTS FROM 2 MICROWAVE OVENS: TRANSFORMERS (APPROX 1250 V 1 A); MAGNETRONS (condition unknown), TIMERS (condition unknown), FANS (running OK). Basis of Power Supply for "Legal Limit" final?

Looking for any particular spare part? Please ask - I have too many old, odd components to list; but I'd rather they went to somewhere they might get USED.

Maybe someone can help find information about the following applications.
I am looking for two system applications:
- A simple transmitter and receiver set that can send a
signal within a house to activate a relay or a light. What do you have
to do this? As an example, I have looked at a typical garage door system
and it will work, but it would have more capabilities than what I need.
- I am also looking for a long range transmitter/receiver (up to
3 miles) to send a simple signal (data burst). What do you have for this?

Please contact me at your earliest convience.

How about a geometric solution?

If it's not an offset feed dish, all you need to measure is the diameter of the dish, and its depth. Then apply some high-school geometry (y**2 = 4ax) and you can read off any numbers you need. Measure the depth at several radii and do some curve fitting if you want better accuracy.

One suggestion that worked well when I helped my Dad refurbish a surplus dish for C band satellite tv - if it's not sagging too far, a heavy rope will sag in a parabolic arc. Handy for bashing the dents out. We embedded an old car rear end in a concrete foundation as the basis for the dish mount. Cheap, worked a treat, and survived 120+ kmh wind storms.

> after all.
>

If you want to lease a T1, ISDN or such, yes. However, in California, I pay Pacific Bell $16 a month for my line. That includes unlimited free local calling. Any LD charges are done through any choice of carriers, such as MCI, ATT, Sprint, etc. We choose our own LD carrier, and now it is commonplace to choose your own local carrier. Rates are extremetly competitive.

However, for home-telephone service, US$16 a month is not a bad deal, especially considering I racked up 110 hours of internet connect time last month.

> There is no such thing as a free lunch.

True, but our phone service here is close to it. Rates for business/commercial on the other hand are priced very differently.

I have done it. 10 years ago IKEA K&#65533;chenlampe braun (brown lamp for
kitchen) was used by European amateurs on 10Gc/s ssb, but the applying
the abovementioned method showed that efficiency of this IKEA lamp dish
is dubious, the light appears on 3cm broad area on the rod, so gain was
only 25-26dB compared to similar size dish which has 30dB.....

1990. Balloon Transmitters

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-22 00:00:00 UTC
From: Joshua Rozovsky <JoshuaRozovsky@gwsinc.com>
Message-ID: <6cq7umjbl1@newstand01.iconnet.net>
Source record: 85975

I am currently organizing a balloon flight. The first flight will carry the required hardware (radar reflector, parachute, etc) and two small transmitters, one for 2m and the other for 28 MHz. I am going to use the PIC-based IDer (featured in January QST) to send the following in Morse code every 3 seconds at 20 WPM:
"N3YAR Balloon Beacon"
However, the IDer will only generate THAT message. I need to transmit it. If I could, I would like an alternating tone in between the 3-second messages. Something like "Hi-low, hi-low, hi-low" alternating tones. My question is, how does one design a transmitter for 28 MHz and 2m, and how do I make it send alternating tones, if that can be done. The IDer will act as a keyer for it.
Thanks & 73,
Joshua I Rozovsky, N3YAR

It's already happening... the 47GHz part of the spectrum, later this
year, may see the first evidence of this. The amateur band up there is
in real danger if the commercial people "run out of space"...

Has anyone ever tracked a cat?

My wife lost her pussy two days ago..... :-)

Luckily it returned

So as not to go through this stress again I would like to Construct a low current FM 100-108Mhz transmitter
so that using an appropriate Yagi antenna I could track the position of the cat.

Could some kind person link me to an appropriate site or forward a schematic.

Many thanks.

It has everything to do with all aspects of amateur radio. One individual with a bruised ego has decided that amateur radio no longer serves what he considers his agenda/purpose/deranged ideals. There is always someone out there with an equally warped sense, or lack of, purpose in a position to make things happen. Burt cares only for himself. He's proved that time and time again. As with a puppy that messes off the paper, the time has come to rub Fisher's nose in it and not only call his bet, but to raise the stakes as well.

If you're not interested, by all means, use the killfile/delete feature of your newsreader.

1998. Re: 4CX250 tubes - When did they start making them right?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-22 00:00:00 UTC
From: Bob Miller <bmiller@calweb.com>
Message-ID: <34F0E5C6.D4B07AAF@calweb.com>
Source record: 85983

Hi Mate,
I think you can use just about any 4CX250 that's rattling around today. I have a couple of old Collins 618T(3) transceivers that use a pair of these rascals and they have seen a jillion hours operating at 30,000 feet plus in all forms of mitary and or commercial aircraft no problems. There may have been some early problems when Eimac converted their small power grid tubes from glass/metal welded to ceramic metal welds. But I believe that millions of these tubes have seen service in both military and commercial service with little or no failure prolems that could be traced to gassing. BTW I have use Eimac, RCA, and GE ceramic/metal tubes for over thirty years and the only failures I can recall were end of life emission failure and an occasional UHF cavity melt down that would take the tube/tubes with it. These melt downs were usually caused by poor tank design (Too High Q) and unsatisfactory cooling systems when running the tubes at the brink of failure..
Now one could probably make a case for not using the smaller power tetrodes in the ceramic/metal packages due to their kind of crappy IMD performance in linear service, but even distortion levels can be maintained at the -30 db level with proper negative feeback or degeneration to mention but a couple of trickes.

That's all I have at the moment.

What say fellows and gals?

Gary OM,

How right you are! So many consumers (which is, to me, a derogatory term, meaning advertising believers, in previous times known as suckers) cannot seem to understand that higher octane gasoline does not give you more power, or more mileage, from an engine designed for lower octane. It is a physical impossibility. I first discovered this while reading a 1918 textbook on internal combustion engine design. It is interesting how very little fundamental knowledge is really NEW!

Best 73,

Don, W6JL

Gary's right, with some caveats. If the reflecting surface is a
parabola with a high f/D or a spherical surface, you can move the
feed around in the focal plane (or more properly, the focal surface)
without unacceptable defocusing. These conditions are typically NOT
met for a RF dish; however, optical telescopes depend on this property.
And I have some personal experience with a 340' dish at 21 cm (f/D=1.5);
it does work at RF if you're thinking big.

What was surprizing was a level of the change. It could be 10 microH at 2 MHz and 2 microH at 20MHz. If one uses toroids for high pass filters, the attenuation at high frequencies can be much lower than calculated.

There's an empty connector originally intended for a extended frequency
converter. It is not shown on the schematic. If you ground pin 14, the
readout will program from 0 to 999 MHz.

I hooked a 6.8K resistor from UHF1 to UHF2 on the band unit. This enables the
existing front end
to run in the 905-999 frequency range.
Mine worked up to 925 before the oscillator went out of lock. I expect you
could tweek the insides
of the front-end module to shift the range up to get to 950.

If you want lower frequencies, the radio is set up to tune 0-20, 20-40 and
40-60 MHz. with a 73 MHz
first IF. All you need is three VCOs, a couple of mixers and an oscillator to
mix the 73 down to 10.7.
If anyone has implemented this board, I'd be interesteed in the results.

DISCLAIMER: I HAVE NO INSIDE INFORMATION. ALL THIS WAS DETERMINED FROM
REVERSE-ENGINEERING ONE UNIT. MY DESCRIPTION MAY CONTAIN ERRORS. YOUR
MILEAGE MAY VARY. PROCEED AT YOUR OWN RISK. I AM NOT RESPONSIBLE
FOR YOUR BROKEN RADIO.

I am a technician no-code and I am looking for a homing device one which is very small and light weight, and has a range of at least 1000ft. This is for my cat who likes to stay gone for too long at a time. Any info on homing devices will help. URLs or schematics.... anything..

Man, every house I see here in the states has a DBS dish. Get your
facts right.

> We are now moving rapidly towards digital TV systems here, and wide

DTV is reality now in the top 10 markets here in the U.S. It will be in
the top 31 markets by 4Q98, and the top 70 markets by 4Q99. That's most
of the U.S. population.

You obviously haven't seen enough TV about what goes on in the states.

Source record: 85803

Has anyone ever tried to convert a 49 MHz walkie talkie to 6 mtr? The circuit seems simple enough, with the crystal being the same as the xmt freq. I have tried by just turning the tuning slug, but it becomes very unstable, shifting between 49.875 and 60.225. Can anyone see any problems with just changing the crystal??? Power out is 150 mw FM.

Just curious!

Paul
N3PEE

"But for every one of the liberated prisoners, the day comes when, looking back on his camp experiences, he can no longer understand how he endured it all. As the day of his liberation eventually came, when everything seemed to him like a beautiful dream, so also comes the day comes when all his camp experiences seem to him nothing but a nightmare.

"The crowning experience of all, for the homecoming man, is the wonderful feeling that, after all he has suffered, there is nothing he need fear any more -- except his God."

Holy Cow, Daryl, how many groups did you post this to?? Sorry...but I trimmed the response to just r.r.a.homebrew...hope that works...it seems like the right one.

You could do it two different ways...either put a transmitter on the cat, or a receiver...well, you could put a receiver-transmitter (transponder), I suppose, instead.

Transmitter on cat: you use a direction finding antenna to find the cat. You really don't need much power for this, as long as the cat isn't in the habit of burrowing underground or crawling into culverts. 1 milliwatt should be PLENTY. There's a cute Motorola IC that can do this sort of thing, crystal controlled...you could add a tiny 555 to pulse it on occasionally. Would involve some construction. 445MHz would be a reasonable frequency. And you might get interested enough in fox hunting to get involved (or start??) a local group!

Receiver on cat: (smiley face on...) You could try to whisper sweet nothings into the cat's ear through the receiver, but if he doesn't come to your calls now, he probably wouldn't then. But you could also hook it up to give him a good shock, so he'd let out a loud MMEOWLLL when you key your transmitter...making him easy to find. (Sorry...smiley face off)

Transponder on cat: Kinda like the transmitter on the cat, but there are ways you can get more info. You could get round-trip times for the RF and get an idea of range. (Tough to do very accurately!!) You could put a GPS on the cat and have it report back the location when queried. ...

OK, OK, only the transmitter seems to make much sense. Power budget: 10mW. Package it in a 9V rechargeable battery case, using 3 of the 6 cells for power (removing the others to make room for the transmitter). 100mAH...should run for quite a few hours per charge. Pulse it to extend the life further...say 5 seconds on, 10 off. Antenna can be the collar that holds the transmitter on the cat. You can arrange to recharge thru the same terminals as you use for the antenna...and those are just the battery term's.

--
Cheers,
Tom
tomb@lsid.hp.com
OK, but what about the IDer?
Don't want the cat to get busted for illegal operation. :-)
If you keep it low power and out of the ham bands, you maybe don't need the IDer
to be legal.

Sorry, Larry, but 56K is quite fast enough for an internet connection.
There are several repeaters and systems up in my area running today, and
the long term goal is for a full T1 connection via radio (at about 5.7
GHZ).

You might also want to look at the beacon transmitters that the wildlife people use to track birds and other small animals - things definitely smaller than a cat. These typically operate for months or years from small button batteries, so they are very stingy with power.

The downside is that they tranmit quite short (tens of milliseconds) bursts of plain carrier. To hear them, you need a receiver with a BFO. An all-mode rig would be fine, but your typical FM handheld receives the signal as quieted carrier and nothing more (provided you turn off the battery saver so the receiver is on all the time!).

The short blips of carrier also mean that techniques that require comparing the phase of the two signals and integrating over a period of time (e.g. Doppler DF) probably won't work. You'll need to use something that depends on antenna directionality to find your cat.

Dave

Hey, lighten up, guys. In England, they have to pay for EVERY phone call,
even local ones and what we take for granted is quite expensive. All he
wants to do is get to the same place as those of us in North America.

I said cheap shot because its always easier to come along ten years later,
make improvements based on what has been learned with an earlier
experience, and then crow about your "superior" system - both of which
will likely be supplanted by new wider digital formats anyway. As for the
Amercians doing nothing, they've been working on high definition new
formats for at least the past decade, which I'm sure you know already. And
I haven't done anything about it because I'm not American, nor do I work
in the broadcasting industry.

>I notice whenever anyone has the effrontery to criticise anything
>American, it's always "a cheap shot".

Naw, the Americans can look after themselves, but it was a cheap shot
nonetheless.

I rather doubt anyone in North America ever had 10m diameter dishes unless
they were commercial earth ground stations. Most of the C Band dishes were
more like 2 to 3 m in diameter, and most of the dbs dishes are about 65 cm
in diameter.

>
> Thanks in advance!!!

Hi Brian

The first part is correct, transponder receive power and commands on a
125khz carrier frequency, but the answer is made modulating power
comsumption. OK I explain better, when you change the resonant frequency
at the receiver coil, in the coupled transmitter coil the power transmitted
goes lower. If you measure the power transmitted, normally measuring
voltage in the coil, you can receive data from the transponder.

For a complete documentation ask to a Philips components vendor

Source record: 85840

I have been wanting to buy a few 4CX250 tubes for a project, but have been afraid of buying anything that is not very new. I have heard that the older tubes had lots of problems with the ceramic seals and would go gassy very fast. I once tried to sell some 4-1000 tubes that were N.I.B. but were actually gassy - they had never been plugged in. RE; 4CX250's, is there a date when certain manufacturers started making them with good seals? If so, what were the mfgrs that did this?

If you reference Dr. Sevick's material, some of which is posted at
http://www.bytemark.com/amidon/content6.htm
you will find that there are MANY strange impedance transformations
available, especially when you start placing these transformers in
series and parallel configurations.

I've seen transformations like 2.25:1, 1.5:1, 5.6:1, etc. The (very
common) 1.5:1 transformer works great, and its very existance proves
that BALUNs do not have to be wound in integer values.

Actually, in his book "Transmission Line Transformers" (Noble
Publishing, available at above named site ...) Dr. Sevick explores the
theory of tapped transformers to yeild such transformation ratios.
Practical designs are available in the CQ publication by Dr. Sevick
called "Building and Using BALUNs and UNUNs." (Of coarse, available
from ByteMark ...)

Using this theory we are producing highly efficient VHF and UHF BALUNs
and UNUNs of various ratios, for use in everything from interstage
transformation and matching to Ethernet coaxial networks.

Contact us if you need more information.

2040. AD - W2FMI Collectors Items

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-23 00:00:00 UTC
From: tracy@orlando.com
Message-ID: <34f1225c.3217117@nntp.ix.netcom.com>
Source record: 85850

Own a W2FMI Original!

Dr. Jerry Sevick, W2FMI, in his years of research has wound over 1000 BALUN and UNUN transformers and has used over 1 mile of wire over a 20 year period. The results of his sensational work are the powerful 2kW to 10kW, 98% efficient 1 MHz to 50MHz BALUNs and UNUNs. This work is featured in over 20 articles, 3 books and the ByteMark website.

Another result of this work is hundreds of wound BALUN and UNUN transformers that Dr. Sevick would like to liquidate. For a limited time, you can get a hand-made BALUN or UNUN transformer, built by Dr. Sevick himself. These carefully crafted transformers were constructed for testing and study purposes during the course of Dr. Sevicks investigation into the theory and practical applications of Transmission Line Transformers.

Each transformer comes with a detailed description of its design, what it would be used for and how it was constructed. The unit will be accompanied by a certificate noting its authenticity, signed by Dr. Sevick.

These transformers are available for $30 (plus postage) until they are gone. We cannot honor requests for specific designs, units will be shipped on a first-come first-served basis.

Don't miss out on this historic opportunity! Be one of the first to have a W2FMI Original BALUN or UNUN in your collection. Email w2fmi@bytemark.com to reserve your unit today!

Or, Place your order on our Secure Server using you MasterCard, EuroCard, Visa, Discover, Novus or American Express. Note the part number as "W2FMI-CC" and the description as "Collectors BALUN." Shipping is over two but under five pounds.

wrote:
>>>> I'm Looking for software to calculate where my feed must be installed on my
>>>> 90cm dish ?
>>>
>>>like at the focal point?
Try this little formula. It has worked for me with dishes from 1.2Ghz
to 10Ghz.

Focal Point = Diameter Squared
- - - - - - - - - - - - - - - -
Depth * 16

or a 30 inch dish with 3.75 inches depth works out like this :
(30 * 30) / (4 * 3.75) = (900) / (60) = 15.0 inches Focal
distance.

F/D Ratio = Focus / Diameter or

15 / 30 = .5

Hope this helps and is much simpler than finding software etc. hi hi

2043. info on Motorola MHW603 vhf power module

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-23 00:00:00 UTC
From: breree@ozemail.COM.AU
Message-ID: <34F12251.513A94B@ozemail.com.au>
Source record: 85853

Hello all,

I have an old supposedly Hi-band vhf radio here which has a power module which I would like to use if possible in an amp for my handheld. It appears to be made by Motorola, and is marked MHW603 on the first line and 852 on the second line. Can anybody confirm if this will be ok for two metres and if so what sort of input power it requires, and what sort of output it should be able to give. I checked the Motorola web site and found similarly packaged UHF modules but not this MHW603. I see in the 97 ARRL handbook they build a 25 watt amp using simillar looking Toshiba power modules.

73s,
Brett

2044. winding coils with F29 and F16 ferrite cores

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-23 00:00:00 UTC
From: breree@ozemail.COM.AU
Message-ID: <34F12615.797D8CC3@ozemail.com.au>
Source record: 85854

Dick Smith Electronics here in Australia sells the following coil forms

and ferrite cores. However, I cannot work out how to calculate the number

of windings to wind for a certain inductance, as the numbers do not seem

to correspond to the A(subscript)l value as used in the Amidon system.

Here are the details:

Former phenolic, OD 4.83 mm, winding height 14mm, threaded for 4mm core

6 pin former base

tinned copper screening can

F29 ferrite, suits 10-220 MHz, ui=12

F16 0.5-15 MHz, ui=125

Now is the ui value inductance per 100 turns, or is there some

other way of calculating this?

73s,

Brett.

I have told this story before. Someone wrote and asked me to re-run it
from time to time. this seems like a good time, so here goes:

A few years ago a young man was at VE at a test session taking the 13 WPM
test. He was legally blind, could have easily obtained a waiver, he did
not want, or need one. As the code tape was playing he had a legal pad and
a felt tip pen with which he wrote the code down, 3-4 characters a page
while all the while flipping pages in the pad. When the tape was over, I
read a question to him, he flipped through the pages until he found what
he was looking for and I would re-read the question along with the choice
of answers, it was multiple choice. He would write the # of the question
and his answer on a page of the legal pad. When he was through I had no
trouble reading his answers, or going through the code he copied and
reading it. He got 8 of 10. He moved after that but I heard he upgraded to
Advanced.

After that, we coordinated on 2 meters while he walked me through in
connecting with his computer, an IBM Compatible, through the phone lines.
My computer back then was a Tandy 2000. It was my first modem connection.A
very brillant young man, who did not let his lack of vision slow him down.

And indeed DTV terrestrial broadcasting starts here in October of this year,
which will neatly leapfrog your primitive analog system. But tell us, Walt, what
sort of color TV did you have in 1954? We had NTSC, you had zip. Being first
sometimes means you don't get to take advantage of an incremental improvement
like PAL due to installed base.

>Maybe some day, too, you will have a 100% digital telephone trunk

We've had cat converters and lead-free gas for 25 years. The only place
you can find leaded gas in the US today is at an airport. Seems you don't
know what you're talking about.

>(A qualified car mechanic told me this ... so unless you're an expert
>on cars don't flame me :)))

The only real benefit to leaded gas is reduced valve wear in certain
older engines. For the past 25 years, we've used hardened valves
and seats which no longer require lead as a lubricant. There are
other ways to boost octane for the high compression engines which
need it than by adding tetraethyl lead.

What your mechanic was probably trying to say is that engine
efficiency is directly related to compression ratio. The higher
the compression ratio, the better the engine's efficiency *can
be* (though it isn't always better in practice, depending on other
design tradeoffs). When lead free gas was introduced, most
engine makers dropped the compression ratio of their engines
from 10:1 to 8:1 because of fears of pre-ignition. But compression
ratios have gradually moved back up as reformulated fuels and
better combustion management systems have become available.

For a given compression ratio, you get best performance by
using the *lowest octane* fuel which does not cause pre-ignition
(knocking and pinging). That's because lower octane fuel has
more BTUs per pound than higher octane fuel. That's something
the fuel companies really don't advertise because they'd like you
to pay extra for higher octane fuel you don't need in the mistaken
belief that it'll make your car run better. It won't.

The best person to go to is yourself. Use a good threaded newsreader with
a regular expression filter capability and you won't see this sort of thing. A
good newsreader allows you to customize what you see so that *you*
determine what you get from a newsgroup, or collection of newsgroups.
Rather than depending on someone else to be your nanny, you can make
your own choices. Freedom, what a concept!

You're welcome.

Cathodeon did some excellent notes on crystal parameters etc. I still use them as the best reference in this area. I've still got one of those typical parameter calculating cardboard "sliderules". Someone mutilated, um, sorry, "converted" our Cathodeon PI-network test adaptor for use with a 1-port Z measurement and I had to buy a replacement when I next needed some serious measurements done and discovered that its innards had been ripped out. From a customer's viewpoint, one of the best crystal companies just vanished without any form of explanation. SEI have shut down as well, now, so the quartz industry isn't what it used to be, I suppose.

Nobody is disputing it. I think Walt's point was that (a) PAL is
significantly less prone to messing up the colo[u]r, and (b) the extra
100 lines make a significant difference to the vertical resolution.

I will refrain from comment on SECAM.

Actually, we did. A number of initiatives going under the heading of ATV
(Advanced Television) have been implemented over the last 20 years
which have markedly improved our analog TV system. The most important
of those is probably the mandatory adoption of RS-170A as a synchronizing
standard. In addition, the near universal adoption of comb filtering to remove
the herringbone rainbow artifact has been a large improvement. And we've
inserted the VIR pulse in the vertical interval so receivers can maintain
correct hue and saturation of broadcast pictures. There have been a
number of other improvements as well, but those three have changed
NTSC from Never Twice the Same Color to Now Truly the Same Color.

But of course DTV will obsolete all of that.

Are you sure about that? If I read the above correctly, you're drawing
the normals to the surface at various points, and seeing where they
intersect. Unfortunately, they don't intersect in a single point (or the
paraboloid would be a sphere) and all of them pass well outside the focus.

Gas as far as I remember never had lead in it. The good thing about gas is that
is is so much cheaper than other fuels for central heating. Much of the UK
electricity supply comes from burning gas as we have large reserves.

>for it.
>Thanks & 73,
>Joshua I Rozovsky, N3YAR
Joshua,
I would modify the PIC program to produce the tones with timing loops. If software is not your thing, then I suggest using some 555 or 556 timers to produce the tones. You could use four timers; one to produce the tone, one as a modulator of that tone, with a 1 second or so interval, a third to detect when the PIC isn't putting out anything for a while, and squelch the tone generator by holding the RESET pin (pin 4 for the 555) low while the PIC is sending CW.

There are several ways of making a 28MHz and 144 MHz transmitter. A few quick calculations reveal that the 5th harmonicv of 28.8-29.6 MHz is 144-148 MHz. THis could be done with a multiplier, or two doublers and a mixer. Another way is to generate a 86 MHz signal and mix it with a 58 MHz signal. If you use a doubly balanced mixer and the signals are relatively pure, you end up with 28 and 144 MHz. The hardest part is the filtering. I have not successfully gotten doublers to work, although others obviously have. There are commercial doublers from Mini-Circuits, but they're probably too expensive. The cheapest doubler in my Mini-Circuits 92/93 RF/IF Designer's Handbook is the RK-3, which runs $15.95. These are wideband doublers which have an input of 50kHz to 150MHz and an output of 100kHz to 300 MHz. The input power is +20dBm max - which is 100mW. The conversion loss is 15 dB max, which leaves you with about 3mW out, max. Obviously amplifiers would be needed between doublers. This doesn't guarantee any circuit you build with these will work - you'll still have to try it yourself - and probably filter it like crazy!. I'm just reading from the data book here.
Good luck!

Brett,
If all else fails, build a toroid with 10 turns, put it in a colpitts oscillator connected to a frequency counter. Using the measured resonant frequency, calculate the inductance. Multilply this number by 100 (yes 100, inductance varies per turns SQUARED) and you have your inductance per 100 turns. Beware of resonant frequencies outside the recommended range as well as stray capacitances, though. This can throw things off.

Even if it were a sphere, the focal length would be HALF the radius.

I greatly favour doing this sort of thing by trial and error. Even if
you do meticulous calculations, you have to finely adjust the thing by
T&E.

Scuse my split infinitive.

I am wondering whether this makes sense at all because the results obtain
at one frequency won't apply to those at another frequency.

I measured a few toroid inductors with the Autek analyzer. Thir inductance
was a function of frequency, with inductance getting about 1.2 -1.8 lower
at a twice higher frequency. Initially I thought that this was a fault of
the Autek analyzer, but for air-core coils the inductance stayed constant.

Works the other way too, manufacturers of metal deposition eg sputtering
equipment use (or used) the change in frequency of a sacrificial crystal
as a thickness monitor.

(In my opinion)Currently the best crystal formulae and application notes
are issued by Telequarz in Ger. Their agents in the UK are Webster
electronics.
The only large crystal manufacturer in the UK now is C-Mac in Harlow
Essex who are offering a quick small quantity service (dont know how
much it costs)
Douglas Dwyer Frequency Precision Ltd.

No! the insult is the ARRL insistence that anyone who applies for an exemption is a cheat and to justify that, they demand full access to a persons medical records without any guarantee they will not be made public by the ARRL or used in a manner detrimental to that person later down the line. Ever paid for a full set of copies regarding a severe medical condition? I have and it cost hundreds of dollars. If you are disabled you will know what I mean. David Sumner is merely the Hachette man for the Board of Directors and is doing exactly what he is told by the board to do.

****

The inductance of a coil varies with frequency due to the
characteristics of the core and to the capacitance of the
windings.

Inductance should be measured at the frequency of use, for
best accuracy.

Most low cost inductance testers use a fairly low frequency
and may not give accurate results at frequencies where the
core has different characteristics. Hence, air cores don't
change much and iron cores change a lot.

Nothing unusual in what your have found.

Additionally, if a coil carries DC current, the inductance
may vary as a function of the amount of current, depending
again on the core.

Receivers using comb filtering and the VIR pulse don't mess up the
colors either. The alternate line phase of PAL was once an advantage
in editing, but today with the universal use of RS-170A that's no longer
a problem for NTSC. And the extra resolution of PAL is more illusion
than reality. The 4 MHz video bandpass only allows 232 pixels per line
horizontal in either system, and NTSC has 262.5 vertical lines in a 3:4
aspect ratio, so we already have more vertical resolution than horizontal
resolution. The major difference is PAL's 25 Hz frame rate (flicker flicker)
as opposed to our 30 Hz frame rate. That's very noticable, and annoying.

And you can take advantage of this in a number of interesting ways.
The inductance change is very nonlinear, but over a small range
it can be used to "tune" the circuit. This is for *small* signals only.

And if you are using a toroidal transformer, you can switch the
AC signal by winding a third winding on the core and feeding DC
to it. With no DC on this winding, you get normal transformer
action. With enough DC to drive the core to saturation, you
will get virtually no transformer action for the AC signal. This
works best with small easily saturated cores.

There are a number of other tricks you can do too, consult a
book on magnetic amplifiers and controls. How practical
is any of this, I dunno, but it is instructive.

On many occasions back in June 1997, when you first dragged this dead horse
out, you were repeatedly asked when was the last VE session you administered.
You never answered. In fact, your response was, that you didn't know there
was a time factor and before the time factor was revealed you volunteered that
several other VE's had not administered a testing and they had not lost their
VE status. Interesting that you would on one hand make such comments and yet
never once answer a direct question posed to you.

Many keep saying 2:2 impedance can't be done without taps.

I built a 2 to 30 Mhz, 20 kw 2:1 impedance transformer.
No taps, but it's kinda both series and parallel connections; in a
figure eight pattern.
There was an article and a patent, about 15 years ago.

What a silly idea! Of course we can buy diesel wherever we want. There are some of the older VW Rabbit diesels running around here, plus the odd Mercedes. Where on earth do you guys get these far-fetched notions about North America?

The reason diesel isn't very popular is because:

1. It stinks more than gasoline when the engine is running,
2. Diesel engines produce less power than equivalent sized gasoline engines (in
cars, anyway),
3. Diesel engines are harder to start in cold weather,
4. Diesel fuel here costs about the same as gasoline
5. Diesel engines are generally noisier than gas ones.

I suspect point 4 is the deciding one, though.

Hi,
Get a cheap 64Kbyte eprom and code 16 locations associated with the
16 inputs connected to the address lines of the EPROM and the contents
of the EPROM could be your BCD or any other code combination you want
for the 16 lines. Kind of a big chip and using only 16 locations out of
65,535 may seem wasterful, but still cleaner than the pile of diodes you
want to avoid. I think there may be some PALS out there that would also
do the job if you have a programmer for them. Cheap eprom programmers
abound and I use the erprom method often to make encoding/decoding
arrays for quicky projects.

One thing to note, they usually wind secondaries for a higher voltage
to compensate for resistive losses in the winding, so if you hook them
up backwards, you get less high voltage than you expect. Not much,
5 or 10 percent.

>the next test using 2ft dish and 100mW the signal was 59+++

I assume that the contacts are made using troposcatter in normal
situations (and not as tropo ducting just over the surface of
Skagerack).

>Is it possible increase beamwidth when monitoring the band, or will I
>have to use 2 dishes, one for listening for DL/PA/OZ/SM/G sigs and one
>for working them on cw/ssb?

In classic geometric optics (ray tracing), the beam can be widened by
moving the light source out of focus. This can be easily demonstrated
in a floodlight if the reflector can be moved relative to the lamp. On
3 cm, the wavelength is large relative to the reflector and simple ray
tracing is not accurate, but you have to look at it as a wavefront,
but the result is similar.

BTW, have you tried to locate some shipboard radar antennas, which
have long, flat reflectors). They have a narrow beam in the horizontal
direction and a very broad beam in the vertical direction (hoping to
get at least some power towards the horizon in a tumbling boat in
rough sea). Turn up the reflector with the long side upwards and you
have a narrow beam in the vertical direction (to get the power close
to the horizon) and a very broad beam in the horizontal direction (to
search for stations from unknown directions).

If you are operating troposcatter, the path loss increases by 10 dB
for each degree the signal has to bend in the scattering air volume.
Thus, it is very important to beam closely towards the horizon and
minimize the radiation going high in the sky (escaping to space) and
reflecting from the ground (or sea) to the sky, without reaching the
scattering volume. In this way, the vertical beam width should be very
narrow (to a limit, since a too narrow beam would not fully illuminate

the best scattering air volume).

If you have a reflector, which is 1.5 m high having a vertical beam width of about 1 degree and a width of only 10 cm, the horizontal beam would be about 20 degrees (which would be very nice for searching for new stations), a my quick back of the envelope calculation indicates, that the gain would be about 30 - 40 dB. The gain would be about the same as your current antenna, but the beam would be much more usable. It is also much easier to set the antenna at exact wanted elevation than setting an antenna to a desired azimuth (without using the stars or GPS).

Besides, it is much more easy to transport a highly elliptical antenna than a round one, with the same area. Although other (ordinary) people are used to see parabolic antenna, they might find it a bit unusual, if someone is holding a "surfboard" or a "canoe" in the vertical position on the shore :-).

Hello--
One company manufactured a line of devices called "Increductors"-- Kay
Elemetrics used these in several models of RF sweep generators as a
frequency-swept element by driving the appropriate winding with a
sawtooth current.

One could also make a case for ignoring Eimac's "kind of crappy"
recommended operating conditions for 4CX250Bs and Rs in class AB1. If
you are less greedy for power output than Eimac suggest, and also use a
well-regulated screen voltage, you can get something like 250W PEP per
tube with very good IMD performance. There are more details on my web
pages.

Also there was the Tuning Indicator on some Pye valve wirelesses. The anode current of the last IF stage flowed through one coil on an iron core; the other coil went in series with the 6 V AC heater supply and a 3 V filament bulb!

> in editing, but today with the universal use of RS-170A that's no longer

Down here in Europe we say Never Twice the Same Colors vs Perfect Art Lines ;-)
Pse no flames, just kidding... We don't even have PAL in France, but SECAM...
Well my SONY camcorder uses PAL and my TV set can understand both.

> a problem for NTSC. And the extra resolution of PAL is more illusion
> than reality. The 4 MHz video bandpass only allows 232 pixels per line
> horizontal in either system, and NTSC has 262.5 vertical lines in a 3:4

Hmm, 100 vertical lines are 100 lines more !

> resolution. The major difference is PAL's 25 Hz frame rate (flicker flicker)
> as opposed to our 30 Hz frame rate. That's very noticable, and annoying.
>
Hence the 100 Hz digital TVsets which double the image scan rate, no more
flickering at 100 Hz, 60 Hz is not even enough, 50 Hz is terrible...

It seems that the TV standards scan rate used to be matched with the mains AC
frequency to cope with the electromagnetic field produced by the transformer
and generating beat distorsion in the images. At least with matched scan
rate, the distorsion was stable...
I guess it is no more a provblem as of today, considering the multiple
scan rates of PCs. Transformers are probably well shielded.

These days, TVs and monitors don't use 60 Hz transformers at all.

A TV or fixed-frequency computer monitor typically runs the horizontal sweep off rectified line voltage, and derives all of the other voltages it needs from extra windings off the horizontal sweep transformer. So any magnetic interference is phase-locked to H sweep - no beat frequencies possible.

Multiscan monitors are a bit more complex since the H sweep has to operate over a wide range of frequencies. They typically use a separate oscillator, still at relatively high frequency, for the power supply.

Even back in the very early days of video, depending on the vertical sweep to be the same as the line frequency couldn't have worked for network programming. The local electric grids in various parts of a country as large as the US or Canada are not locked together, yet all TVs were locked to the sync generator at the studio where the TV cameras were located.

Try www.gpsemi.com

You'll probably have to do a search, then select the option to search the obsolete parts database when the 1st search comes up negative.

If they don't have the datasheet in pdf format, email the address from the web page. I did this & they faxed over a copy of the chip spec I was after. Helpful guys.

2100. ht w/DEM transverter

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-24 00:00:00 UTC
From: Steven Jackson N3VZL <steve@gnosis.slac.com>
Message-ID: <Pine.LNX.3.96.980224150236.17315H-100000@gnosis.slac.com>
Source record: 85756

Greetings --

I'd like to know if anyone has used a DEM transverter with an HT. I spoke to someone at DEM, and he said that he needs some kind of control line to key the transverter. It should be easy enough to wire something up between the HT and a hand mic that could use the PTT to key the transverter. Has this been done? Would I find FM activity on 902, 5GHz or 10GHz? I'm assuming that I will, but you never know. What about attenuating the signal before the xverter.. how would I?

And why does TenTec know how to do RF-sensed transverting with 5W in for half the money? Something doesn't add up. I know they only do 2m (or 20m) <-> 6m, but still.

Also, on page 52 of the Dec 97 CQ VHF, there's a simple circuit for using a gelcell as an all-day battery for an HT. In the schematic, three are three lines feeding straight down into a triangle. What are those triangles? I see the capacitors on two of them, but I don't think I've ever seen the triangles before. Any help?

Thanks, everyone.

Steve

<snip>

My comment was aimed at the poorer fuel consumption experience after
the introduction of catalytic converters (not at the use of unleaded
fuel)....my original posting underlined the cat converter with the
^^^^^ symbol but it did not come out that way on the newsgroup!

When questioning the dealer who supplied our latest car (a 1.2 litre
General Motors thing) about the poor mpg (only 32 in the city and a
bare 40 to 42 on the motorway) and comparing this performance to our
previous car, a Fiat of the same capacity (44 in town and 56 mpg on
the open road) we were informed that catalytic converters degraded
mpgs by as much as 30 percent or so...

Anyway, what's this to do with amateur radio? :))

2102. Sell-Trade Large Air Variables

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-24 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bd4163$db107ae0$448a92d0@davidc.bit-net.com>
Source record: 85758

I have the following two air variables, and am looking for a different
value air or vacuum variable:

Sell/Trade:
E.F. Johnson 100pf .350gap 11KV
Unlabeled 350pf .170gap 6KV
(both very clean)

Wanted:
Air or Vacuum Variable (Vac. Var. must be reasonably recent manufacture
with a solid seal) min. 488pf, min. 1.5 KV rating

I am building an antenna tuner and the circuit specifies min. 488pf, though
I think I probably don't want to go much beyond 550pf.

Offers?

One of my 3-500Zs looks rather dark next to the other <grin>. They've given me good service. Time for a refit.

Anyone out there with a recommendation as to where to find GOOD tubes? The ones I have are Eimacs.

Thanks.

HUH?

Leaded gas was very cheap petroleum distillate (low octane=~70 or so)
spiked with tetraethyl lead -- (CH_3CH_2)_4Pb -- as a cheap way of
bumping the octane up. 15 drops of tetraethyl lead added to a gallon
of 70 octane gasoline would bump the octane up to 100. This was great
until the lead started damaging the environment. Then we had to pay
more for higher quality gasoline with more expensive additives (like
Methyl-tert-butyl ether -- MTBE).

As far as I know (still a student pilot) 100LL Av Gas (100 octane low
lead) has no lead in it at all, but the name is still used from when
there were several varieties of Av Gas available (At least that's what
the guys at the air service tell me).

I don't think gasoline was ever made from coal -- at least not in any
commercial quantity. It was considered back in the 70's when gas
prices were skyrocketing, but petroleum based gasoline would have had
to go up to $3.00/gal (1970's US dollars) to be cost effective.

God gave you a free will, and the "democracy" you complain about not having is, in fact, exactly what you do have and is persecuting you. Why haven't you simply moved to another country? You could qualify for a station license with hard work and only the usual amount of beauraucatic politics, and wouldn't have to look for handouts to have a voice.

2106. Any Ideas for Amplifier Keying Control?

Newsgroup: rec.radio.amateur.homebrew

Source record: 85762

I'm in the midst of designing a simple circuit that will use a low impedence source voltage that is +12VDC key up and 0VDC on transmit as a control voltage that energizes the relay in an SB200 and an SB220.

The amplifier keying lines are -120VDC and +120VDC, respectively for the two amps, both keyed to ground on transmit.

I'd like to do this without having to have another relay controlling a relay, needless to say. So, before I reinvent the wheel, does anyone have any suggestions for a high-impedance input device that could be put to such a use or control another device that could? It's important that the input be high-Z, since if I pull it down too far, it will key the transmitter! (It's essentially the PTT line, which will be pulled down either by a mike switch/VOX or the keying circuit within the rig.)

All my manuals are vintage books (1970s!!). Thanks in advance.

I haven't done it, but it certainly looks like those single channel 49MHz walkie talkies could be easily converted to 6 meters. After all people were converting 27MHz CB sets to 10meters and even 6 Meters long ago. Make sure that it is in fact an FM unit, and not one of the ultra cheap units with a superregenerative receiver. The ones with superregen receivers are meant as toys, and never worked well when I was kid (though they were on 27MHz in those days). The 49MHz walkie talkies with a superheterodyne receiver are limited by the antenna and their legally restricted output power, not by simple circuitry.

I'd double check the walkie talkie you do have, because your description almost sounds like it might be a superregen unit. The single channel superhet ones will have a transmit crystal that operates at 1/3 the transmit frequency (though it might be marked with only the actual transmit frequency, there will be a crystal for the receiver at the signal frequency minus the 10.7MHz IF (according to the manual for mine, this is an overtone at the desired frequency) and a 10.245 MHz crystal to make the second conversion in the receiver form 10.7Mhz to 455KHz.

I've appended down below someone's post about making the conversion. I haven't done this, but it seems to be useful information.

The multi-channel superhet jobs are not so easy to convert. It's been discussed before, and I can't remember if anyone came up with an easy method. I'll have to look some more because I might have something about this on a disk somewhere.

I am actually surprised, and I've said it before, that these 49MHz superhet walkie talkies have not been the focus of more attention. Not only can they be converted to 6 meters (and since they use a separate

crystal for receive and transmit, one could set them up for repeater use), but they bring up other possibilities.

There was an article in QST a few years ago (I don't have the date handy) where one of these was used to feed a 220MHz transverter, making a cheap 220MHz lunchpail type transceiver. That article mentioned that a transmitting converter was not too suitalbe for 2meter use, because of getting rid of unwanted signals, but it missed the obvious, of moving the transmitter to the 48MHz range and tripling it to 2Meters.

I'm not sure about the front end, but the IF strip is pretty much the same as that in a Radio Shack 2meter monitor receiver that they used to sell. One could bypass the front end, and use the IF strip for various projects. PUt a front end ahead of it for 10 meters or 2meters or whatever, and you have a fairly simple to build FM receiver. Or you could forget about bypassing, and just add another converter ahead of the receiver. Transmitters are not so difficult that building a complete unit would be that much more difficult than trying to rework the existing transmitter.

If you have a receiver that has a 10.7MHz or 455KHz IF (such as a CB set converted to 10Meters), you could add FM capabilities by patching the IF strip from the walkie talkie into the existing receiver's IF.

I think, though I haven't examined them, that some "baby monitors" have a superhet receiver and they operate in the 49MHz range. If so, they too could be converted to something else.

Cordless telephones are also a possibility since they operate in that range, though conversion may not be as simple as the walkie talkies.

I mention these last two because they are the sort of thing that show up at garage sales, and also because they are fairly common, there may be broken units around in more quantity than walkie talkies.

Michael VE2BVW

Below is the post from a while back about converting 49MHz walkie talkies. I haven't tried this.

From: mgarrett@prairienet.org
To: All Msg #328, May 16, 96

Subject: 49 MHz to 6 Meters
Organization: University of Illinois at Urbana

Conversion of single channel FM radios to the 6 meter band

There have been many requests for information in conversion of some of the Radio Shack and Maxon 49Mhz FM radios to 6 meters.

I hope to let others know that it can be done to certain radios quite easily, while to convert others may not be worth the effort.. I have converted one Radio Shack TRC-505 and two Radio Shack TRC-509's to 52.525 Mhz by re-rocking and tune up. From what I have learned I will pass on to you to help you in determining if you have a radio that is convertible and a general overview in how to do it.

In determining the radio. It is best that you consider only the single channel FM radios that are available from Maxon and Radio Shack and a few others. These radios will either be the walkie/talkie type or the headset type. These radios will have 3 crystals inside. A transmit crystal in the 16.61-16.63 range a receive crystal in the 39.13-39.19 range and a 10.245 Mhz crystal.

Radios that are from Radio Shack and have the name "Archer" on them may be a AM radio and are designed for the kiddies to bang around. These radios only have one crystal in them (usually 49.860 Mhz and a TRF receiver in them. These radios are not convertible for 6 meter FM. If you have a radio that you are not sure if it's AM or FM, get a scanner and listen to it's transmission. If it has a good quality to the audio then it is FM. If the audio is low and scratchy sounding then it is probably AM. The kiddy radios also do not have usually squelch and so there is continous white noise out of the speaker. If you still are not sure, open it up and count the crystals.

The 5 channel units that have come on the market recently are not good conversion items either. Their chips are designed around cordless phones and although they can be moved into 6 meters by changing the clock crystal, they do not fall on the 6 meter FM channels. They are not worth your time or effort to convert unless you can reprogram a chip to cover the specific frequencies that you need.

Now that you have eliminated the duds from the bunch, I will say some things that you might want to consider before starting a conversion these radios. They were designed with part 15 in mind. They only put out around 40 mw or.04 watt and the antenna system is made to be somewhat range restricted. If you convert one to 6 meters you will still only have 1/4 mile range tops if you do nothing to that dinky antenna. On a decent 1/4 wave antenna at a decent height of 30 feet you can expect around 3 to 4 miles range. These radios would make a excellent low power base radio if you place a connector on them or as a exciter for a home brew amp but then you are tied to a coax at the least. I have not found a good antenna for these radios that will fit in the original design.

Their receivers are ok but are prone to intermod. I have picked up a local 50kw FM broadcast station on mine. This is due to a

lack of a front end on these units. Another thing you might consider is to instal a small pot for setting squelch. This mod I want to do since the fixed resistor squelch is set somewhat high on the units that I have converted.

Now if all I have said so far has not deterred you from conversion then go for it. You can get schematics for Radio Shack units if you give them the model number. For the TRC-509 it runs around $15 and you will have to order it. It is worth it. The schematic from the TRC-505 was included on the owners manual and it is so tiny that I cannot read the resistor values even with a magnifying glass (the printing resolution is poor at this level and they should have taken two pages for the drawing). For Maxon and other units you might need to contact the manufacturer directly for schematics.

Recommended equipment: General coverage receiver, frequency counter, scope with at least a 50Mhz bandwidth and signal generator that covers the 6 meter band, FM modulation preferred. If you do not have the signal generator a low level signal can be generated from a nearby radio until the first stage has been tuned, then if you have a programmable scanner you can use the IF to provide a low,low signal level for fine tuning.

Confirm the radio's specs prior to conversion. Check receiver sensitivity, transmitter output (on the scope)or miliwatt meter (most cb wattmeters wont detect the low level output these units have even on the 10 watt scale).
Crystal information:
Transmitter FO = Fundamental X 3 (F0= frequency of operation)

Receiver FO - 10.7 MHZ = Fundamental

Example: transmitter and receiver on 49.830 Mhz

Transmitter 49.830/3 = 16.61 Mhz
Receiver 49.830 - 10.7 = 39.13 MHZ
Confirm operation of the crystal fundamentals using these formulas to agree with your radio. Use a general coverage radio and a scanner to find the crystal carriers(Remember the transmit crystal will not be in operation unless the transmitter is keyed).

I used a 30 pf load and 25 degree temp celsius in ordering these crystals. I used Jan Crystals as my supplier. No mater who you use let the crystal company know what you are installing these crystals in. They may have information vital to making these crystals work. Use HC-18 style crystals with wire leads. If you are modifying the ht radio you will have to lay the transmit crystal on it's side to allow it to work with the case on (the top of the crystal hits the speaker, the receive crystal is ok to instal upright). Since the new crystals do not have plastic on

them, use some sort of insulation material to keep from shorting out the upright resistors adjacent to the crystal such as electrical tape around the crystal body. In the TRC-505 a smaller crystal can was used for the transmitter but in the TRC-509 they used a HC18 style and laid it on it's side already. The headset type should not have this problem but check it out prior to ordering.

Start with the transmitter. Use the general coverage receiver to determine crystal fundamental operation. Frequency accuracy can be set later. Use your scope with a 10:1 probe on the antenna output lead, key the radio and tune the first and second coils for maximum output on the scope. Then place probe on tip of antenna and tune antenna for maximum. If the antenna is telescopic, extend all the way. Re tune the entire transmitter stages again, for maximum output. Now set the crystal frequency with the coil next to the crystal and deviation pot(it is labeled L7 on the TRC-505 and with the transmitter fully tuned at this point it should be readable on a frequency counter. You might also want to drip a little wax down in this coil once tuned. Wax is better than coil paint because you can always melt the wax later and re-adjust, with coil paint you break the coil.

The receiver is a little tricker. First prepare a small insulated wire, stripping both ends. You will have to attach this wire to the demodulated output of the receiver IC. In the TRC-505 it uses a MC3357. Solder this wire to the demodulated output on pin 10 and clip your scope lead to this wire, again a 10:1 probe and your scope on AC, internal trigger with your ground clip on one of the metal coil cans. You will be looking at a display of white noise on the scope and the goal of this is that you will be looking to minimize this white noise as you tune the receiver up to the signal generator. As you tune in the generator and the noise is reduced to quieting, you need to reduce the amount of rf to the receiver, keeping just enough noise on the scope to determine your progress. If you have a audio tracer it can be used on this point as well, listening for a reduction in white noise. Instal the receive crystal and check for operation on a scanner listening for a carrier (the crystal will be weak so a frequency counter probably is not useable so that is why you need the scanner). Tune the fundamental in on the scanner (example for radios receiving on 52.525Mhz-10.7Mhz= 41.825 fundamental. Adjust the receive netting crystal for maximum quieting on the scanner. On the TRC-505 this coil is L4 and is located on lower left of the board (it is the coil closest to the receive crystal you installed).

Apply a signal with no modulation to the antenna input. Apply just enough to cause the noise level to drop. Adjust the coil between the rf and 1st mixer stage (L2 on the TRC-505) and work your way back from this stage to the 1st mixer crystal (L4 on

TRC-505) and repeat. There are really only two stages that you need to tune but you will have to repeat tuneup several times, each time reducing the level of the signal generator to leave at least a little bit of noise on the scope. You should be able to get the receiver down to around .5uv or less.

Once you get the receiver tuned to this point turn on a tone from your signal generator and set deviation to about 5 khz. Adjust the quad coil for maximum audio. In the TRC-505 this is L3 and is located near the demodulator chip and the 455 khz ceramic filter. If you do not have a frequency generator you can adjust this coil by fully deviating a radio on frequency by a long helloooo or other favorite fully deviation tricks, watching your scope for maximum signal level. Now that you have done this your receiver is tuned. Remove the wire from the demodulator Ic and apply a drop of candle wax to the receiver netting coil. Re assemble the unit making sure that no wires are pinched and the transmit crystal clears the speaker and does not crush components in the ht version. You have now completed your conversion.

This article gives a rough guide on how to do a conversion to one of these units and hopefully your conversion will be a smooth one. I have tried to keep this as broad as possible to cover the different versions of radios out there and the amount of equipment and skill each person has in doing the conversion.

If anyone has experimented with improvements to the antenna system with either the hand held or hands free unit or has built a amplifier to bring these units up in power, let me know.

If anyone has questions regarding conversion, drop me a line and I will try and help. Much of my information that I have here is limited. Good luck on your conversion.

There seemed to be comments to this that I'm not sure who added. I'll add a couple of points.

I don't think it's a smart move to fiddle with the second conversion oscillator in the receiver. I don't think the ceramic filter in the 10.7MHz IF is very narrow (I haven't checked, but it conceivably could be as wide as those used in fm broadcast receivers, as wide as 280KHz), but it just makes things more complicated. If these use the MC3357 FM IF strip like the single channel units that I have, one could move the 10.240MHz crystal to it's proper place on that IC. The schematic in the manual is horrible to read, so I won't give the details. But the 3357 has an internal oscillator where the crystal goes, which presumably is fed from the oscillator in the synthesizer on the mutli-channel jobs.

Interesting point that. In fact our local Sainsburys has started selling
'low sulphur - City Diesel' I asked what this was all about and was told
that it is being introduced across the country, although this is the
first time I have seen it. Price is 1p/ltr on top of normal price. Small
price to pay for lower emissions? I really wanted to know what 'exactly'
is the composition of it? On my Open Uni degree course this year we have
been looking at alternative fuels and one of them is an alternative
diesel fuel derived from rape seed oil. Apparently called 'bio-diesel'
it has very low sulphur emissions, low particulate discharge but stinks
like rotten cabbage when used! I also wondered about performance so such
fuels? Although the local bus company is using this low sulphur diesel
to such an effect that all the taxi drivers are using it, but it seems
that they think it gives better MPG than normal diesel.

Natural gas burns much cleaner than any other fossil fuel (CO2 and SO2)

Predictions are that current 'known' reserves will last until at least
2025

Nothing wrong with the A40. I used to have one of those.
Petrol prices then were at about the silly level they are
in the USA today so the MPG didn't matter quite so much!

My present one uses the fuel of the future - diesel.
It returns 50 mpg from a 2-litre direct-injection
engine (with a catalytic converter).

Just about everything's illegal in Canada.

I've been led to believe that, provided all the traffic
passed over any (theoretical) Internet/Amateur Radio
interface is originated by and destined for licenced
Radio Amateurs, then such an interface would not
be illegal.

2125. DECIMAL TO BINARY ???

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-24 00:00:00 UTC
From: Cyberhax <i676532@thegrid.net>
Message-ID: <34F392CB.4B5F@thegrid.net>
Source record: 85781

Greetings:

In the middle of a small project I realized that I need
to convert Decimal-to-Binary, preferably using a chip.
What I need to do is just the ooposite of what a
74154 does, which is convert a 4 bit input to one
of 16 decimal outputs. I need to ground one-of 16
inputs and have the output of its 4 bit binary (or
bcd) equivilant.

I really don't care to fool with a bunch of diodes
and am hopeful somebody will be able to help by
leeting me know if there is an IC that will perform
this chore???

Thanks in advance for the feedback,

Shawn WB6JWB

Diesel the fuel of the future? Not likely....Hydrogen is far more likely
as a fuel of the future than any fossil fuel, especially when the only
byproduct is water.

Actually, there is argument for completely flat rates at the national
level for telecommunications - i.e. no toll charges for long distance at
all both in Europe and America.

I find it difficult to understand your hostility to flat rate local calls,
though. What is your basic objection?

It seems to work just fine in North America.

Given the present debate about a VEC on the newsgroup let me ask you this question. "How comfortable would you be turning your complete medical History over to some of these guys and how long do you think it would be before one of them posted your whole medical history for the world to see?" Can't happen! don't bet on it.

Hi,

The ui value is the flux concentration factor relative to air of the core material only. It is useful for calculating the inductance of toroid cores (closed magnetic circuit). With slugs however, depending on the design of the enclosing casing (some are ferrite, others are just the shield can), most of the path goes through air. In a toroid, ui=125 would give 125x inductance compared to an air toroid of the same size. For the slug however, the inductance is more like 2-5x. This makes them useful for higher frequencies where you might actually want *more* turns instead of less. Because of the air gap, non-linearity and saturation due to DC current is not a problem (the wire is likely to

overheat first).
There is no general accurate inductance formula for slug inductor turns. The only formulae or tables that work also specify the exact shape, position, and number of layers of the winding on the core (difficult to do for a small slug). The problem is really quite experimental; make a 10-20turn winding and measure the inductance with the core screwed half way. Then based on these results, estimate the number of turns for the inductance you want. Alternatively, just use a convenient (and sensible) number of turns and find a capacitor to resonate it. Then fine-tune with the slug.

: devices will help. URLs or schematics.... anything..

Holy Cow, Daryl, how many groups did you post this to?? Sorry...but I trimmed the response to just r.r.a.homebrew...hope that works...it seems like the right one.

You could do it two different ways...either put a transmitter on the cat, or a receiver...well, you could put a receiver-transmitter (transponder), I suppose, instead.

Transmitter on cat: you use a direction finding antenna to find the cat. You really don't need much power for this, as long as the cat isn't in the habit of burrowing underground or crawling into culverts. 1 milliwatt should be PLENTY. There's a cute Motorola IC that can do this sort of thing, crystal controlled...you could add a tiny 555 to pulse it on occasionally. Would involve some construction. 445MHz would be a reasonable frequency. And you might get interested enough in fox hunting to get involved (or start??) a local group!

Receiver on cat: (smiley face on...) You could try to whisper sweet nothings into the cat's ear through the receiver, but if he doesn't come to your calls now, he probably wouldn't then. But you could also hook it up to give him a good shock, so he'd let out a loud MMEOWLLL when you key your transmitter...making him easy to find. (Sorry...smiley face off)

Transponder on cat: Kinda like the transmitter on the cat, but there are ways you can get more info. You could get round-trip times for the RF and get an idea of range. (Tough to do very accurately!!) You could put a GPS on the cat and have it report back the location when queried. ...

OK, OK, only the transmitter seems to make much sense. Power budget: 10mW. Package it in a 9V rechargeable battery case, using 3 of the 6 cells for power (removing the others to make room for the transmitter). 100mAH...should run for quite a few hours per charge. Pulse it to extend the life further...say 5 seconds on, 10 off. Antenna can be the collar that holds the transmitter on the cat. You can arrange to recharge thru the same terminals as you use for the antenna...and those are just the battery term's.

It's a very nice challenge. My pennyworth is to suggest battery recharging by cat's movement: tiny magnet in glass tube with long fine coil round it - maybe even curved collar-shaped tube. Then a Cockroft-Walton rectifier-capacitor ladder to pump the charge into the battery whether the movement is vigorous or slinky. Such things are coming into use inside watches and pacemakers. No, I have no idea where to obtain one - not too difficult to make, though.
Good luck-

Great discussion.
The late Doug DeMaw published an excellent study on slug-tuned
inductors and ferrite rod inductors in his book "Ferromagnetic Core
Design and Application Hanbook", published by MFJ.

Of coarse, you can get it at
https://cybermall.orlando.com/bytemark and look in the books section.

2145. Variable beamwidth/gain with an SHF dish?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-24 00:00:00 UTC
From: LA8AK@RV2.4P710.no
Message-ID: <34f20b26.10159659@news.sol.no>
Source record: 85830

Hi
I may have posted this before.
Problem: 35-40dB gain on a dish is often too much to find stns to work.

I remember when we work first LA-OZ on 3cm cw/ssb. LA6LCA first worked OZ1HDA with 100mW at either sides with 57/579 report. Then I worked OZ1HDA with 1mW to a 25dB horn pointet almost in the right direction. This indicated that during the first QSO a wrong QRB was used, and in the next test using 2ft dish and 100mW the signal was 59+++

Is it possible increase beamwidth when monitoring the band, or will I have to use 2 dishes, one for listening for DL/PA/OZ/SM/G sigs and one for working them on cw/ssb?

I am considering buying a SG-2000 for remote use. The current receiver is Icom 736. The Icom shows recv.sensitivity of 0.2 uV for 10 dB S/N and the SG-2000 shows 0.5 uV for 10 dB S/N with +/- note. This seems like a lot of difference (7.9 dB by voltage formula/?) to me, but some old timers say the difference will be hardly noticable. Any ideas on this? email k4yc@qsl.net

Yeah, but it was cat converters that forced adoption of lead free gas.
The lead poisoned the platinum catalyst. Turns out there are other
benefits to removing the lead, however, such as much longer spark
plug life. The valve wear problem was the only real downside, and
that's a solved problem.

>When questioning the dealer who supplied our latest car (a 1.2 litre

>mpgs by as much as 30 percent or so...

Then GM Europe is trying to cut corners. We've had low backpressure
cat converters over here for years. Our big V8s and V10s wouldn't be
happy with restricted breathing. The MPG for our vehicles has increased
since the introduction of cats. Of course a low backpressure cat is pretty
large, probably wouldn't fit under the shoeboxes sold in Europe, but a pair
of them go nicely under a 4x4 pickup (which our government just informed
us in a backhanded way is 25 times less likely to result in a fatality for its
occupants than an econobox in a collision). There are good reasons why
we like to drive heavy iron besides the fact that it makes a wonderful
counterpoise for our HF antennas.

>Anyway, what's this to do with amateur radio? :))

Nothing. But it is a nice break from the code/no code wars.

Oh I don't know about that. We had fully electronic television (525 line 60 Hz)
starting with round the clock broadcasts from the New York World's Fair in the
30s. And by 1948 we had a national network (NBC) running a full schedule
offering newscasts and entertainment programming. CBS joined in soon
after, and ABC came in with a full schedule 10 years later. How long did it
take before you had 3 full schedule (7AM to 1AM) competitive national networks?

Yeah, but then you didn't have an installed base of 100 million sets
in the 1950s either. We did. When we went color, we had to stay
compatible with that base. Of course our TV has always been
private enterprise and has had to maintain a customer base. Your
government owned monopoly could care less.

>10m diameter dishes like miniature radio telescopes in your backyards.

Actually that was 3 meter dishes. 10 meter dishes were only needed for
uplink stations. Now nearly every suburban rooftop seems to be sprouting
a 45 cm dish for DSS (500 channels). But there are still a lot of the older
3m dishes in rural America. DSS has a monthly charge. Most of the C
band programming is still free (or dirt cheap) because it is advertiser
supported. I have a 3m dish and enjoy watching a lot of the raw pre-feeds

on the back haul channels, and have been since distribution went to satellite in 1984. Have you been getting satellite TV that long?

Greenhouse gases. Oh the horror!!!

>Predictions are that current 'known' reserves will last until at least
>2025

And we've operated under a projected 25-30 year reserve every year
since 1900. In 2025 they'll probably be telling us we have enough reserves
to go until 2050, at a higher price of course. Meanwhile we have right here
in the US alone enough proven coal reserves to meet the world's energy
demands at current levels for 1,000 years. Of course we aren't using much
of that right now. Most of our generation has switched to natural gas, gotta
eat up that 25 year reserve you know so the gas companies can increase
their prices.

If anyone seriously cared about the environment, we'd stop greenhouse
gas production cold and switch to a fully nuclear powered energy system.
We have tens of thousands of years worth of proven reserves for that.
Instead of gigatons of CO2 and megatons of fly ash to dispose of every
year, we'd have a few hundred pounds of hot stuff to pile out in a desert
somewhere and put a fence around.

But that won't happen because 1 in 7 jobs revolves around fossil fuel
production, distribution, and consumption. There's too much money
and too much vested interest in keeping that system going to its last
gasp.

Ah, well. Germany is reunited now. I hear they have
some pretty good tanks. Tell me, what's the life
expectancy of an archduke in Sarajevo these days?

If it were up to me, all our boys would be home right now.
Too many have died in Europe this century cleaning up
your messes. Next time we should stay home and let
you settle it among yourselves.

And that goes for the Middle East too. We should sell
them all the arms they have cash to buy and let them
go at it until they all kill each other. After the glass
cools down a bit, Bechtel can go back in and reopen
the wells.

2165. FM Radio Card Details

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-25 00:00:00 UTC
From: wb9whi@aol.com
Message-ID: <19980225062000.BAA25791@ladder02.news.aol.com>
Source record: 85654

FM Radio Card Details

Part 1: The Hardware
I have noticed several brands of FM Radio Cards on the market in the past few years. Until they went below $20.00 each, I didn't see much point. When Tom, N9UDL pointed out that there was a Linux Driver available with Source Code, I couldn't resist. I went to the Local Wal-Mart and picked up a Reveal RA300 card. I found a TEA5712T Am/FM receiver chip on it, and a Sanyo LM7000 AM/FM Frequency Synthesizer as well as a few other chips of lesser interest. This board has a Audio Amplifier which will drive 8 ohm speakers and a software controlled volume control. Best Buy is now selling an identical board under the
name Aims Labs. The card is called "RadioTrack!". These cards have a base address of 30F Hex or 20F hex, with 30C Hex being the default. The control address is actually 30f Hex or 20F Hex, 30F being the default.

Recently, Surplus Direct has been selling a Packard Bell radio card for around $12, or $9.88 over the web. While this card is no longer available, there doubtless have been quite a number given as gifts over the holidays and there are probably a few hams who are wondering what to do with them. These cards have a base addresses of either 358 Hex are 350 Hex, 358 Hex being the default.

These cards also have a Philips TEA5712T AM/FM receiver chip, and a Sanyo LM7001 AM/FM Frequency Synthesizer chip. These cards have neither a volume control nor a power amplifier; these functions either must be provided by the sound card, or some other means of amplification. These cards were meant to be used in Packard Bell computers with a connector to a Packard Bell Sound Card. It hooks to the Modem port on the sound card of my HP Pavilion perfectly. I can't hear the Modem connect while it's hooked up, of course.

Both of the Data Sheets for the Receiver and the Frequency Synthesizer chip are

available on the web in Adobe Acrobat format. The Receiver chip is available at
http://www.semiconductor.philips.com. The Synthesizer chip data sheet is available at http://www.semic.sanyo.co.jp/english/catalog/index-e.html The receiver chip of both types of cards has a VCO tunable by a varactor diode and air-wound coil, and an IF stage consisting of two ceramic filters. According to the data sheet, the input and output impedances of these stages is 330 Ohms. All of the narrower filtersI found seem to have a much higher impedance. The cards seems to have a stock bandwidth of around 200 kHz. There is also a signal strength pin, which yields a voltage between zero and five volts. The pin is at zero volts when the signal is at full strength, and at five volts when there is no signal present. This is an analog output - you may attach a voltmeter or a meter movement with an appropriate series resistor (the resistor value depends on the full scale current of the meter). I used a small dB meter

movement and a 3.3 K resistor. These cards use +5 Volts, +12 Volts and I/O addresses - neither RAM, IRQs nor DMAs are used.

Tuning the cards outside the Broadcast band:
Tuning the cards outside the band means adjusting the Local Oscillator coil on the Receiver chip. I have experimented with this on the Packard Bell card. The
data sheet says the Synthesizer should go to 130 MHz max. This means it should receive up to 140.7 MHz max. To my surprise, I was able to tune the card all the way up to 162.55 MHz. The tuning voltage on the Packard Bell card can be measured quite conveniently by connecting an ordinary VOM between the two header pins next to the receiver chip and ground. The card will receive when the tuning voltage is between zero and about nine volts. To extend
this range, the coil can be tuned or changed. On both cards the VCO coil is the
one most toward the front of the computer, or farthest away from the real plate.
I found three turns around a 3/16 inch drill bit will tune to 162.55 MHz and ten
turns around a 1/4x20 bolt (wind the wire in the threads of the bolt, then remove the bolt) will tune down to 65.75 MHz. Some tuning can be done by spreading the turns of the coil apart from each other, spreading the end turns all the way until they are resting flat onto the card. Please note: The only way to know if you have tuned the card outside the VCO range is to monitor the tuning voltage and/or to listen. Once you've reached one of the limits, the receiver stays at that maximum or minimum frequency - it won't go any farther.

When you go too low, tuning simply stops. When you go too high, you will enter

a range that has a weird warbling hum as the VCO voltage climbs to approximately
9 volts.

Part 2: Programming the Cards
All programming information has been taken from the Sanyo LM700x data sheets and the Linux Driver website for the Reveal RA300 radio card at http://www.cs.ucr.edu/~quay/notebook/node4.html, possibly no longer available. The information on the Packard Bell card was then found by experimentation and with the use of an ohmmeter. Tuning both cards involve sending 98 bytes of data to the card. This may seem excessive until you realize how the cards are interfaced. The LM700x chip has a three wire serial interface, one is the data

line, one is the clock line and one is an "active high" enable line - each connected to one line of the data bus. The chip takes 24 bits of serial information. To strobe the bits in, the clock line is brought low, then high, while the data bit is held constant. This accounts for 48 bytes - two for each

data bit. Since the LM700x has a setup and hold time of 1.5 microseconds, each

byte is sent twice in order to slow down the data enough to be accepted by the Synthesizer chip. Two bytes are sent at the end to bring the enable bit low and

thus latch in the frequency. The catch is that these bits are assigned
to different bits on the different brands of cards. The Reveal and Aims Labs
cards are essentially the same, but the Packard Bell card uses different bits.

The Reveal/Aims Labs cards have the following bit assignments:

```
Bit Function
----------------------
0 Enable (Hold high until all bits are clocked in)
1 Clock (Data is clocked in on rising edge)
2 Data
3 Radio On/Off
4 Tie Low
5 Tie Low
6 Volume Down (Active Low for 200mS)
7 Volume Up (Active Low for 200mS)
```

The Packard Bell cards are slightly different:

```
Bit Function
----------------------
0 Radio On/Off
1 Enable (Hold high until all bits are clocked in)
2 Unknown/Tie High
3 Unused - not connected
4 Unused - not connected
5 Unused - not connected
6 Clock (Data is clocked in on rising edge)
7 Data
```

The Serial Data Format sent to the "Data" bit is as follows:

```
Bit Function
----------------------
0 Synthesizer setting bit 0 (Least Significant Bit)
1 Synthesizer setting bit 1
2 Synthesizer setting bit 2
3 Synthesizer setting bit 3
4 Synthesizer setting bit 4
5 Synthesizer setting bit 5
6 Synthesizer setting bit 6
7 Synthesizer setting bit 7
8 Synthesizer setting bit 8
9 Synthesizer setting bit 9
10 Synthesizer setting bit 10
11 Synthesizer setting bit 11
12 Synthesizer setting bit 12
13 Synthesizer setting bit 13 (Most Significant Bit)
14 Test Bit (Always 0)
15 Test Bit (Always 0)
16 Band Data 0 (Always 0)
17 Band Data 1 (Always 0)
18 Band Data 2 (Always 0)
```

19 Time base Data (Always 0)
20 Spacing Mode 0 (Use 0 for 25 kHz and 100kHz spacing)
21 Spacing Mode 1 (Use 1 for 25 kHz and 0 for 100kHz spacing)
22 Spacing Mode 2 (Use 0 for 25 kHz and 100kHz spacing)
23 FM or AM Synthesizer input pin (FM=1/AM=0) Always 1.

Bit 0 is sent first and bit 23 last. This holds for all cards using the LM700x

chips.

To obtain the setting, take the frequency in MHz, adding or subtracting the IF frequency (depending on what VCO range you want to use for what range of frequencies), divide the result by 0.025 and change to an integer. Send the resulting number serially to the proper bit of the proper address, making certain to send exactly 14 bits. Then send the remaining 10 bits as described above, drop the enable line, and possibly set the bit to turn the radio on. Three spacing settings are available for the FM synthesizer: 25kHz, 50 kHz and 100 kHz. It may be possible to divide the crystal down and obtain more resolution by feeding the result into the XIN pin of the LM700x chip, but I haven't had time to try this.

Part 3: The Bench Jig
Both types of cards use an 8 bit ISA slot. The connections are labeled A1 to A31 and B1 to B31. A1 and B1 are at the rear of the computer, next to the back

plate. Facing the back plate, A1 is on the left and B1 is on the right. Rotating the back plate to the right, A31 is on the left and A1 is on the right.
Rotating the card so that the Back Plate is on the left, B1 is on the left and B31 is on the right. The Packard Bell card uses only 20 of the 62 fingers in the 8 bit slot connector, the rest being non-existent. The Aims Labs cards uses
22 fingers in the connector, the rest being non-existent.

Here are the connections for the jig:
PIN Description
A2 Data bit 7
A3 Data Bit 6
A4 Data Bit 5
A5 Data Bit 4
A6 Data Bit 3
A7 Data Bit 2
A8 Data Bit 1
A9 Data Bit 0
A11 Address Enable (Tie High through a 10k resistor to +5V)
A22 Address bit 9
A23 Address bit 8
A24 Address bit 7
A23 Address bit 6
A26 Address bit 5
A27 Address bit 4
A28 Address bit 3

A29 Address bit 2
A30 Address bit 1
A31 Address bit 0

B1 Ground
B2 Reset (Normally low, pull high to reset card)
B3 +5V (Where used)
B9 +12V
B10 Ground (Where used)
B13 I/O Write
B14 I/O Read (Tie high through 10k resistor)
B29 +5V
B31 Ground

The jig consists of connecting the data lines of the parallel port to the data lines of the radio card. Tie the address lines to the control address of the card (e.g. 20F Hex). Tie the STROBE line (DB-25 pin 1) to the I/OW pin (B13).

Ground the BUSY and PAPER Out lines of the parallel port (pins 11 and 12). Ground the serial port (DB-25 Pins 18-24 and sometimes 25). Supply +5V and +12V, bypassing with 0.1 uF capacitors, modify the software to write to the parallel port instead of the slot address and you're done. I have not tested how carefully the power supplies to these cards need to be regulated.

I hope some of you find this information as useful and as interesting as I have.
It accounts for nine months of experimenting. Use this data at you own risk, just in case I have made some mistakes, or something is less than clear. Soldering almost certainly invalidates the warranty.

There are many possibilities for these cards. My next project is to try to build the Packard Bell cards into a car stereo that will receive the amateur bands. Any questions or comments are welcome.

The one that quickly comes in mind is/was the CMOS priority encoder
MC14532 with 8-input 3-output and some cascading pins. Two such
devices should give 16-input and 4-output. It seems to have positive
logic at input (active high), so it might not suit your application.

There might be more modern (and hopefully also 16 input) priority
encoders in other logic families.

Look for a chip by the title "priority encoder." It should do what you want.
(The function is not really "decimal to binary" conversion, thankfully.)

RIGHT while I have had the flue over the last few days and have not checked this little posting (which is growing into a monster !!!!) for a little while, I was amazed to see it has grown from my inital posting to 89 thus far!!!!!!!! Going from Internet access via Packet radio, somthing about govermnet should pay for everything, to TV, to Vehicles GAS etc etc etc HUH!!!!!! MAN!!!!!

OK well I found out what I wanted to find out, best help was from David TSE, and a link to force9 etc, i was able to find out that the technology IS available to actcheive FULL internet connection via Packet Radio. NOW wheather the HAM laws on Packet radio contents will allow internet access in England, and IF things might be changing (loads thing changing in this country NEW labour) new laws etc etc and wheather there is a line of site gateway from my location within say 60-100 miles of me, has all yet to be determined.

But my initial thoughts of wheather the technology exits has been answered YES IT IS. I Have found that it is Possible.

It may interest all who have responed to my initail posting that i
have found another way of connecting to the net which if is successful
will give me 120hours/month FULL internet access VIA ISP through a
MOBILE PHONE FOR JUST £32/month, which price also INCLUDES an ISP
monthly charge of £12...YES I KNOW BUT IT IS TRUE.

ITS not full free access but 120 hours FULL Internet access for £32
all in aint bad at all PLUS its legal.

So 89 Posting upto now....I wonder what the world record is on postings to a NewsNET posting is? Anyone know? Wanna Join this Fast growing Posting?

DO TRY AND KEEP IT TO DIFFERENT WAYS OF CONNECTING TO THE NET, USING ANY FORM OF TECH. RADIO, MICROWAVE, CABLE, TELEPHONE, SAT, ETC ETC ETC WHATEVER. IT MIGHT TURN INTO A USEFUL GUIDE YOU NEVER KNOW.

IF YOU CAN GATHER YOUR DATA AND POST ALL WILL BENEFIT, COULD BE GOOD THIS.WILL HAVE TO WAIT AND SEE.

DREAD TO THINK WHAT WILL HAPPEN AFTER THIS POSTING!!!!!!! hehehee

TO ALL

Cheers

IAN

I think that you need a scanner that will tune the aircraft frequencies (118 to 135 Mhz). Not many common radio receivers will tune these frequencies.
Good Luck Walter

Right, I'd say I'm glad to belong to the technology aware Ham community,
the arguments are generally based on rational physical reasons and this
is the kind of discussion I like. As opposed to the kind of discussion
some people have when arguing about the last soccer match and giving
exclusively subjective arguments (they seem to know it, and they seem
to like it).

Though I noticed in this thread some "mine's bigger" arguments, tssk, tssk...

Economy of scale, in various ways. You can get more efficiency
in a power station running at a constant and predictable average power
than in a domestic heater cycling on and off. Wherever you burn the gas it
will produce the same amount of pollution, but if the process is inefficient
you need to burn more. But it's *not* simply to produce *heat and light*
somewhere else: when was the last time you saw a gas-powered vacuum cleaner?

Amateur radio will survive Burt and his ramblings without any problems because he comes across as a crackpot and will be treated as such by the press. The thing that bothers me is that Burt claims to be a teacher. I have to wonder how he is effecting his students with his views. I also wonder if the school administrators and parents know the type of personality that is in a position to influence young and impressionable minds?

The hydrogen fuel cell is quite amazing, but as Walt puts it nicely,

Duh! A bit confusing!

The concept fuel cell is working fine in Australia and there are a
number of websites carrying info on hydrogen fuel cells but I wonder how
much the petroleum companies would like that be put to bed!

The problem with all fossil fuels in the release of CO2 that was fixated
from the atmosphere millions of years ago in the plants and animals that
ended up as crude. We are currently releasing it much faster than it was
fixed in the first place and thats the problem.

Dunno if the hydrogen cell will ever take off but its a start!

True - but most diesel cars have bigger engines/turbos than petrol

>3. Diesel engines are harder to start in cold weather,

Wrong, thats why they have heaters! My landrover at work starts day in
day out without a problem and thats in some of the worst weather in the
country!

>4. Diesel fuel here costs about the same as gasoline

Cheaper here

>5. Diesel engines are generally noisier than gas ones.

Not true. Modern diesels are just as noisey as a 5 year old average
family saloon. And having seen some of the wrecks wandering around here,
better! Can't say my landrover is quieter though! But I would like to
see your family saloon climb a 3000ft mountain road in winter!

>
>I suspect point 4 is the deciding one, though.

I have changed over to diesel in the UK because of the cost. I believe
recent figures show an upward trend in EU towards diesel.

Natural gas is lead free! Its mostly a a mixture of methane and ethane,
it burns cleanly with minimal sulphur emssions (0.7 mg per Mjoule
compared to 910 mg for coal)

The coal gasification process that was used for town gas was terrible!
It was full of horrors and thats one of the reasons for its demise! It
wasn't really cleaner than coal but seemed that way at the time!

Reserves sizes are never fixed because:

1. Better technology to discover/exploit reserves
2. Increased price = increased profits = more investment for 1.
3. Technology increases allow exploitation of lower grade ores etc
4. Third world countries now cashing in physical resources

BTW current 'mineable' world reserves are estimated at 500 years, not
unless you want to start digging up areas of national parks etc and the
US has approx 26% of world totals giving you something around 100 years.
Certainly not the 1000 years you estimate. You are correct in the
reducing useage of coal. But only until that becomes too expensive to
mine, or the environmentalists get you!
>
>If anyone seriously cared about the environment, we'd stop greenhouse

Yep thats right good old nuclear. What is it about americans and their
fixation with atomic anything. Its not just a few hundred pounds of hot
stuff either, its thousands upon thousands of kilos of lowgrade waste

like clothing/tools etc that need to be disposed of. And then what about the stations when they reach the end of their life, you going to bury that as well! sic. We already have enough waste to worry about. Oh and atomic energy is safe? 3 mile island and Chernobyl prove that its not and when things go wrong - as they do - then you end up contaminating billions of sqaure kilometres. Some farmers in the highlands and lakes are still not allow to sell lamb because of the high levels of Strontium 90 in the meat, caused by Chernobyl fallout.

>
>But that won't happen because 1 in 7 jobs revolves around fossil fuel
>production, distribution, and consumption. There's too much money
>and too much vested interest in keeping that system going to its last
>gasp.

Agreed.

But the US don't want to do anything about it. The 1992 earth summit proved that. The Bush administration of that time attempted to torpedoe the whole damm thing by vetoing adoption of targets and timetables for CO2 reductions even though studies showed that it was easily met. They even embarressed Willaim Reily - the US delegate - by leaking his memo to Bush saying that they could easily meet the target and could he agree to the CO2 and Biodiversity treaties.

Your latest government is pretty much of the same.

Instead of looking at nuclear/fossil fuels - we need to be looking at renewables, wind/wave/tidal/solar/biomass. They all have their own problems (environmental too) but they can cut global warming by reducing CO2/NO2/SO2 emissions. No power source can at the moment be perfect but we can improve matters, it just needs co-operation and governmental agreements, something which does not seem to happen from your side of the pond

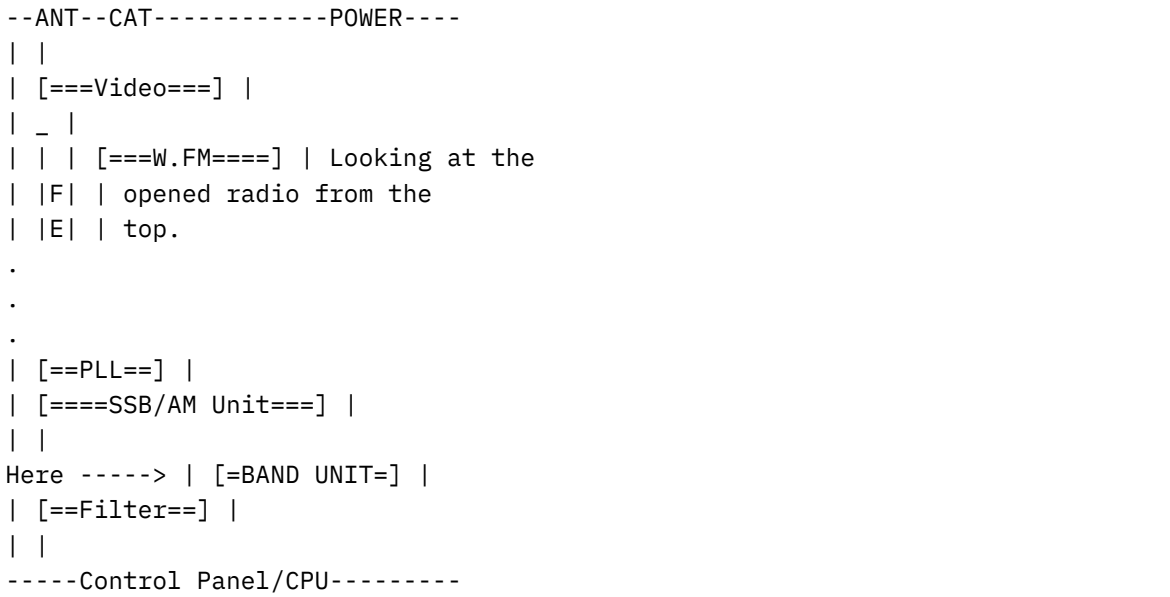
Author: Daniel WCC, 9V1ZV
Date: 4 February 1994
Subject: Band extension mod for FRG-9600/965

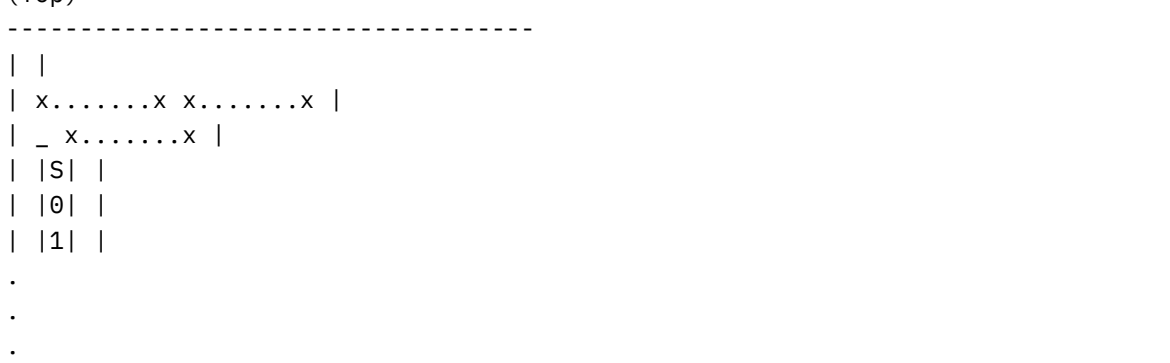
Foreword



Since I bought my second hand FRG-9600, I have been fervently looking for mods for the radio. I have seen mods for so many other scanners, I could not believe there was not even one for the FRG-9600. This was quite disappointing as I liked the idea of making mods to radio. Recently I received my service manual for the radio and the result of which is this simple mod. All you FRG-9600 people out there, use your creativity. I am not sure if opening up the radio and performing the mod will void your warranty so you may want to check it out first. I can only say that this mod works perfectly for me but will not accept responsibility if you destroy your radio by your own mistakes.

Description

The original range of the FRG-9600/965 was from 60 mHz to 905 mHz. Looking at the circuit, however, revealed that YAESU had originally designed the radio to cover HF as well. Not only that, it also had coverage up to 950 mHz. I suspect that there had originally been intended a module for HF frequencies which is supposed to fit into the empty slot (J8001/J9001) next to the VHF/UHF front-end unit. For some reason, this option never materialized, maybe for commercial reasons! Anyway, it seems that some provision had been made on the Band Unit module to go ahead and make use of these bands anyway without the dedicated HF front-end. Thus, we can now enable reception from 20 mHz to 950 mHz with no gaps in between. Unfortunately, the sensitivity is not fantastic at the fringe frequencies but nevertheless signals can still be received. If you have a computer on, the RF emmission from the PC is likely to drown out most of the 30 mHz band anyways so you may want to go manual on these bands. The 905-950 band is more acceptable and works fine pulling in cellular on those channels. You will probably hear some of the RFI generated by the radio's on-borad CPU here and there also.



Modification

The mod itself involves soldering in 3 jumper wires onto the Band-Unit.
The Band-Unit is the closest module to you on the left. Carefully remove the cover of the radio by unscrewing the 4 screws holding down the top cover. In order to remove the cover, you need to push it back about 15 mm before lifting it so be sure not to apply undue force. Be sure to remove the power supply before beginning.

This gives you the idea of where the Band Unit module is located. The actual module names are printed on the main PCB so take a closer peek and you will see which one is which easily.

Now that you have identified the module, look carefully at it. You should
see that there are some holes near the top which are drilled but unoccupied.

The above diagram shows the component side of the Band Unit which is what you should see looking at it from the front of your radio. Note that the slot marked S01 is unoccupied. If your's has a switch on it, make sure it's open because it disables the 450-950 mHz bands if closed. If your radio does not have these bands, check this switch and also check to see if it has been hard-wired in the closed position.

The "x" indicated where the unoccupied holes are and the "........" indicates the jumpers you must make. If the jumper is already there, then you need not do anything to the radio. The jumper on the top left is to enable 905-950 mHz. The one on the top right is to enable the top right enables the 30-60 mHz range and finally the bottom right jumper enables the 20-30 mHz range. Note, I am not too sure if the mid HF transition is at 30 mHz, could be something else too. You can try for yourself, it is not critical since I put in all three jumpers for my radio. The holes are covered by solder already so you cannot easily insert your jumper wires. Ideally, use a solder-sucker or a solder-wick to remove excess solder from the holes to uncover it first. Do not apply too much heat as the surface mounted transistor nearby may melt or be destroyed. Once you have cleared the hole, slowly insert the pre-bent jumper wires into the holes starting with the one at the bottom right. Remember to clip off excess wire and do not let the wire drop into the radio and possibly short something. Use thin solder and do not apply too much. Make sure that your jumper wires are clean so that the solder will adhere to it easily.

The circuit of the Band Unit suggests that it is actually possible to enable a range even lower that 20 mHz. This is quite pointless however since the front-end is really not suitable for such low frequencies and it is unlike that you can hear anything useful even if enable. If you are interested however, contact me by e-mail. I'll give you more details.

Conclusion

Replace the cover after making sure that no bits of wire or solder are left inside the radio. Now you are ready for fun (provided you did it right). Try tuning from 19.999 (no sound) upwards and see if you get anything interesting. Usually you'll just get RFI. But when you reach about 40 mHz, you may be picking up cordless phones and walky-talkies. Once you are satisfied that works, try tuning from 905 mHz up and see if you get any cellular. Have fun while I study the circuits for more possible mods. I have received news that some FRG-9600s will not permit you to tune manually or by frequency entry, out-of-band frequencies. These frequencies can be accessed using the CAT controller program SCANNER.COM (or SCAN88.COM for XTs) with the very easy to construct interface. Meanwhile I will look into enabling tuning using the dial and keypad. This should be the next mod if its possible.

If you own one of these radios, you may want to check out my controller program and interface (easy construction) for the CAT control of the radio. The program brings FRG-9600 back into competition with the newest scanners.

I've received feedback that although the above mod allowed the radio to tune the entire range, the dial seems restricted. This restriction can be overcome by using the interface for tuning. Alternatively, you might try to reset the machine by turning off the battery for a couple of minutes to see if upon restarting, the MPU recognizes the new bands. This can be done by switching off the internal battery using the switch at the top right hand side of the front panel, under the top cover. There is a tiny slide switch there.

Have fun.

Hello all. There is a mistake with this message I sent a few days ago. I must rapidly correct this so I am forwarding this via the original channel used on the 21st of February. In the message that follows, placing the meter (yard) stick in the belly of the dish intersects the focus. IT DOES NOT! The yard stick intersects the line from the center of the dish at TWICE the focal length. Most sorry for the mistake. 73 Cliff K7RR

Well, here's a BASIC program which might help:

```
CLS

'from: Bahl and Trivedi: "A Designer's Guide To Microstrip Line"
' Microwaves, May, 1977 (pp. 174-182)

'w=strip width, Er=dielectric constant, h=dielectric thickness
'assumes zero thickness strip

pi = 4 * ATN(1)
'DEF fntanh (x) = (EXP(x) - EXP(-x)) / (EXP(x) + EXP(-x))

10 PRINT
INPUT ; "Er=", Er
PRINT
INPUT ; "w=", w
PRINT
INPUT ; "h=", h

IF w / h > 1 THEN GOTO 50
x1 = 1 + 12 * h / w
x2 = 1 - w / h
ereff = (Er + 1) / 2 + ((Er - 1) / 2) * (1 / SQR(x1) + .04 * x2 * x2)
z0 = (60 / SQR(ereff)) * LOG(8 * h / w + .25 * w / h)
GOTO 70

50 ereff = (Er + 1) / 2 + ((Er - 1) / 2) / SQR(1 + 12 * h / w)
z0 = (120 * pi / SQR(ereff)) / (w / h + 1.393 + .667 * LOG(w / h + 1.444))
```

```
70 PRINT
PRINT "Zo="; z0, "Er(effective)="; ereff

GOTO 10

END
```

Just to add my two nanohenries, Vari-L of Denver, Co. used to make
a tunable inductor useful for VHF narrow band low noise vco's. The
problem is the current driver you need has to put out several hundred
milliamps. Try http://www.vari-l.com/ and let us know how you make out!

It's mentioned on page 149 of the sixth edition of his "Amateur Radio
Techniques". That mentions a Wireless World article in February 1965.

Also, QST for March 1977 had an article by VE5KQ entitled "A Second Look
at Linear Tuning" on the same topic. He bases it on the articles
mentioned above.

Hi Gary OM,

Why do you want to replace the tube? Because it looks "dark"?
May have nothing to do with performance. How much difference in
gain or performance is significant to you? Measure the individual plate
currents under operation, and find out if there is any SIGNIFICANT
difference. If you buy one new tube, they may now be
mismatched just as much (or more) than before. Think about it.
On the other hand, if your goal is you just want to spend
some money, there are plenty of folks out there willing to take it!

Wellllll...maybe if you chose the _right_ frequencies. But...why not
let it ID?? A PIC12C509 in 8-pin SMT package will fit in there just fine,
and you can even use it to time the transmissions. (If you get the idea
I'm toying with some fox transmitter ideas...well...)

(Yeah, the lead-acid battery sounds like a way to do it too! Unless, of
course, it's a really big cat.)

Hmmm...brings to mind another "transponder" idea. Receiver on cat. When
special code is received, it ignites a flare, making the cat easy to find
at night.

(Sorry...yes, there is a cat that's adopted me as its human, and has me
very well trained, and gets plenty of TLC from me. I wouldn't actually
DO anything like that, but it can be fun to think of creative ways of
solving problems, and sometimes these hairbrained ideas do lead to
something interesting and practical.)

Actually wanted to comment on Gary's comment, not Brads, but didn't see
Gary's original posting...

If you wind a control winding on the core, be careful that your
drive for that winding doesn't "short out" the signal. That is,
if you drive it from a stiff voltage source, or any source that's well
bypassed for the transformer/inductor operating frequency, it will
short out the signal. It's just like another secondary on the transformer.
So you need to put a choke in series with it.

But another way to do it...and the way that's more commonly used in
practice...is to wind a winding that is not coupled to the transformer,
but can still magnetize the core. For a toroid, it can be a winding over
the outside of the whole core, not passing through the center hole. For
an E-I core transformer with typical construction where the windings are
on the center "post", you can wind a winding on each outer leg and hook
them up in series so that the transformer action from the center windings
to them is cancelled...they have equal voltage in each outer winding, but
opposite directions...but current through them still saturates the outside
loop of the transformer.

Be careful about using this to kill transformer action: if you at the same
time kill the inductance of the primary, you may be putting an unacceptable
load on the primary drive circuit. Certainly it's not a problem if you are
aware, but don't let it surprise you (in a potentially unpleasant way if

you are dealing with much power).

--
Cheers,
Tom

>(7.9 dB by voltage formula/?) to me, but some old timers say the difference
>will be hardly noticable. Any ideas on this? email k4yc@qsl.net

These figures represent the performance of the receivers against
internally generated noise. The reason that they aren't particularly
important on HF is that SNR is dominated by external atmospheric
noise. On HF that typically exceeds 1 uV anyway, so any sensitivity
below that is just of theoretical interest. Sometimes 10m is quiet
enough that you'd notice, but you'll never see the difference on
lower HF.

1 and 2 are rubbish. Do you believe everything you
read in the press?

3 Not here. If you choose to live in the freezer,
that's your problem.

4 As here in UK, but not so in the rest of Europe
where diesel is considerably cheaper.

5 Granted. Slightly more noisy.

This isn't North America. We don't _have_ to do everything
you Yanks do.

We don't have the capacity to support all the great unwashed
being on-line 24+ hours a day. I'd rather pay for local calls
(which are dirt cheap anyway) than suffer the problems caused
by under capacity at the telephone- and ISP-levels.

Far from it. Most gas stations that service the public have at least
one Diesel pump, and they certainly don't ask whether you're fueling
your car or your Kenworth truck.

2214. F.S.: Complete HP141T spectrum analyzer package

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-25 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <34F4D536.5152@pop.removethistomailme.net>
Source record: 85703

HP 141T configuration for sale w/the following accessories:

- HP141T analog storage mainframe
- HP8552B IF section
- HP8554B RF section (coverage to 1250 MHz)
- HP8444A tracking generator for HP8554B, 100 kHz - 1.25 GHz
- HP8553B HF section (high-resolution coverage to 110 MHz)
- HP8556A LF section (high-resolution coverage to 300 kHz
w/built-in LF tracking generator)
- All operating and service manuals
- Spare storage CRT in original sealed HP carton

All units are in excellent operating condition w/good appearance, noting minor paint scratches on 8552B, 8444A, and 141T panels, and missing HP logo on 8444A. .JPG photos available on request.

This package delivers complete analysis and tracking coverage between 20 Hz and 1.25 GHz. Asking $1900 for everything, plus shipping from Austin, Texas. Unit available in Austin, TX for inspection by interested parties. (Come to Austin and pick it up, and you can have it for $1800. :)

There already is a way. It's called a fuel cell. There are buses running
on them now.

You obviously haven't heard a Cummings Diesel in a Dodge pickup. It's
really LOUD. What's so hard, though about driving up a three thousand foot
mountain? That's not very big, as mountains go.

>>
>>I suspect point 4 is the deciding one, though.

>I have changed over to diesel in the UK because of the cost. I believe
>recent figures show an upward trend in EU towards diesel.

Many years ago, diesel fuel here was substantially cheaper than gasoline.
At one time, back in the 70's, using diesel was considerably cheaper than
gasoline. Not any more, though, so why bother with the extra cost of
buying and servicing diesels?

From: J&#65533;rgen Overgaard <overgaard@mailbox.ffc.se>
Message-ID: <mhm0d6.m12.ln@uh4.ffc.se>
Source record: 85707

Hello..
This is my first message in this newsgroup so be gentle will,you?? :-)

I'm currently working on a project that involves a Icom 211E, wich is
a 2 meter tranceiver (made in the late 70' I think)...

Anyway.. Whithout any real documentation (except the manual and schematics)
I managed to analyse the accessory port and it's connection,
and where able to control the frequency with my PC through the paralell
port.
Now I'm planning on using a PIC16C84 for implementation of a very
simple CI-V protocol to change the freq.

"All" I have to do is to code the chip to receive/send on one of it's pins
and control the IC-211 with it's other..

The accessory port was ment for an external keyboard, so...

Anyone got some info on the IC-211 keyboard, or anything else usefull..
I plan to release the schematics and software for the PIC when it's done:
:-)

Anyone got any good address which is not in use by any other Icom stations..
eg 4 is IC-735 etc. etc...

Thanx....

Reply here and why not CC it to my mailbox..

73 de SL4AQ, SL4ZZX

overgaard@mailbox.ffc.se

P.S.
Hope you can read my english, since I'm swedish and may not
spell every technical word right... D.S.

Actually, quite a few current TV sets have mains transformers in them -
somewhat to my surprise.

I don't know about SM supplies being "cheap and reliable" - to
manufacture maybe, not so much for us poor engineers who have to fix
them!

Source record: 85588

I guess I may have led one or two of you astray by trying to be cute and describing the tube as "dark."

Well, dark it certainly is: No filament glow whatsoever. There's a small white glow reflecting off the INTERNAL metal disk beneath the active elements and that's about it. The other 3-500Z appears to be to be much brighter.

What directed my attention to it was that when I put power into the amp, the meter lights (which are across the filament supply between the filament choke and the filament transformer) started to brighten furiously in time to my CW keying! The next thing I did was eyeball the tubes, cabinet in place, and saw one lit tube and one dark one.

Since then I have removed the dark tube and put an ohmmeter across the various combinations of pins. The ohmmeter is a 1.5VDC source. I read 0 ohms betweent the filament pins and infinite ohms from any filament pin to any grid pin. I expected to see a grid/filament short. Perhaps the breakdown needs 6V, but that's stretching it a bit. Comparing to the lit tube, all measurements are identical.

Puzzling. Thanks for all the input..... Gary W2CS

1936, and the BBC had to use Philo Farnsworth's camera, cause theirs
didn't work. Farnsworth's whole system pretty much made Baird throw
in the towel.

The early US systems were 400some lines. The horizontal sweep derived
high voltage must have come after they went to 525, because at 12 kHz,
the flyback squeal would have driven everybody nuts.

You may be suprised, but there are plants on the board right now, that if implemented, can come pretty near 100% safe/100% leak free. And in America, they most likely will end up implemented. Now, getting rid of gas powered cars is going to be another thing entirely. No batteries can yet match the storage capacity per pound of a gallon of 93 octane gas. If they did, I would drive an electric car, but until I have enough power to waste power in my car, I'm not driving a boring electric one, maybe thats just an American thing, but hey, I am what I am. I also will NOT support lead acid battery powered car efforts. I'd rather breathe ash, deal with green house effects, or absorb nuclear radiation than deal with the lead that ends up leaking out from lead acid battery production once it ramps up to the levels necessary to build batteries for every car that will ever be manufactured. At least of I die from ash, green house gases, or nuclear radiation, I'll have my mental faculties until I am too debilitated for it to matter, with lead, that isn't an option.

Just my view,

David

Wi>but I have no idea how to charge them. They are 12v 7amp (lead
Wi>acid I think). What kind of power, amprage, do I use to try and
snip
Whether or not lead acid is very important.

2 fundamental rules are: If lead-acid, charge at constant VOLTAGE
(13.8/12);

If nickel-cadmium, charge at constant CURRENT (written on side; or
capacity divided into 10 hours, then double the answer....er, would a
formula be better?)

The wrong kind of charger is often found built into things like alarm
controls, to make it more likely that the battery will fail and need
replacing every year or so...

>

Thats not too hard. DEM do some nice IF switches that will do the job.
Uses simple RF switching to key the voltages to the tvtr. I am surprised
they didnt know their own stock! There is a little nbFM activity but
most people are on SSB/CW (use an FT290 - dirt cheap) The tvtr usually
requires 1mw in (1 milliwatt!) so you need an attenutator - thats
usually done in the IF interface board.

>And why does TenTec know how to do RF-sensed transverting with 5W in for
>half the money? Something doesn't add up. I know they only do 2m (or 20m)
><-> 6m, but still.

Because they are low performance and not designed for squeezing the last
drop of signal/noise out of the system. These are high performance units
that are designed using the latest spec devices not the run of the mill
6m tvtr. When 6 is open you don't need much in the way of a tvtr!
You will also find that most people require different setups - according
to what else they have in the shack (amps/preamps/antennas), flexibility
is the name of the game.

I'm getting ready to build a beam antenna. This is my first antenna project, and I was wanting to know how to go about matching the feedline to the antenna. Or does it really matter? Should I just run a piece of 75 ohm coax line straight from the radio to the antenna? And what would the impedance be on a 3 element beam? Is the impedance the same for all beam antennas?

Oh yeah, does anyone have the subscribe info on the antenna homebrewing mailing list for ucsd.edu?

Jody W4TDY

I recently read the ad from a Californian Uni for some 60 dollar class E FET amp kits rated at I think 300/500w CW.
I'm told there would be problems operating these units on any phone mode but know that class D & E is currently used in the commercial AM broadcast field.
Question is has anyone on this ng experimented with these inexpensive highly efficient amp's for use on sideband?

What we really out of gasoline are ALL the additives, that way we can go
back to the early vapour carb's patented ideas, reduce emissions to the
high 90's level and get 100-200MPG.
Fat chance.

Three Mile Island (TMI) was a testament to the safety measures
built-in to the US reactors (Soviet reactors are a different story).
The operators at TMI (unknowingly) pretty much did everything they
possibly could have WRONG! Three times the emergency reactor fill
systems were initiated by automatic control and all three times they
manually shut them off! When a steam bubble was forming in the
reactor core, they vented coolant (instead of adding more)!

Still with all this blundering, very little (estimated--might be none)
contamination was released to the outside. When the core suffered
severe fuel element failure, the containment dome sealed itself as it
should (thank God they didn't override that). The Zirconium and
Hafnium core materials (as opposed to graphite in Soviet reactors)
held up to the extreme temperatures sustained within the core and
prevented further fission.

The main problem with Nuclear Power (in the US) is that the technology
is still classified (By the Atomic Energy Act of 1957) and because of
this, the general public has no idea how safe it really is. Only
Three Americans have every been killed related to Nuclear Power. The
conventional plants can't make a claim like that.

Uh, I think that's the general idea behind a transformer, isn't it? :-)

Transformers aren't supposed to exhibit an "impedance" per se, apart
from parasitic losses. The primary of an ideal transformer will take on
the impedance of whatever's connected to the secondary, multiplied by
the square root of the turns ratio.

Some people here make some excellent home-made beer.
Most of it better than the tasteless sap you buy in
the pubs.

>Thought you Jocks drank "heavy" (5 /- or whatever it was)

This 'Jock' is exiled in a country where they don't have
light and heavy. I drink continental lager* as I can't
stomach the English chemical lager or their warm bitter,
which has a lot in common with dishwater (or ink).

>(This is on-topic in rec.radio.amateur.homebrew, isn't it??)

!!!!

* Continental lagers brewed there, not those churned out
by Courage masquerading as Stella or Kronenburg!

Well Walt, that must be your fault. It's generally a bigoted comment from
yourself about G-Nothings, G7s, repeater users, ex-CBers, the "guess-tick"
RAE et al that sparks things off.

If the farts on 80m are that old, why is it "80 metres" not 260ft?

Nick
(a G7, ex-CBer but NOT a repeater user)

Might be where you have high prices anyway - diesel locally has always
been 3 - 4p /ltr cheaper! Hence the purchase of a landrover discovery!

Current price is 59.9p/ltr against 63.9p and 64.9p ltr in two local
emporiums.

2238. KEYER HELP needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-26 00:00:00 UTC
From: kf5nd@aol.com
Message-ID: <19980226221500.RAA15179@ladder02.news.aol.com>
Source record: 85605

I need a keyer. My straight key is too slow now that I'm getting to 20 WPM.

I'd like to build my own keyer. What would you recommend as a good keyer project ?

I want to keep the costs and parts count rather low. It would be great if I could buy a kit, that would simplify matters considerably.

What brand of paddles should I consider getting ?

I meant the sort you buy in Boots, or at least the sort I got for my
birthday last year - 40 pints just add water & wait 14 days. 39.5 pints went
down the drain.

Agree re: the lager. Myself I prefer Bavarian wheat beer or Belgian Gueze.
Haven't enjoyed a pint of 'Heavy' for 10yrs or so.

If the radio is within spec (freq wise) across the band, the vco voltage
is probably correct. Now one thing you can check., is the amplititude of
the vco decreasing as you go across the band. If this is true you will
have a lower signal into the mixer,,,,,lower power out. One last thing
when you you notice a decrease in power do you notice an increase of
current draw??? This could indicate an impedance mismatch. If its
lower,...look at the vco.

Hi Richard,
There are solvents that may clean them up. What ever you do do NOT use a pencil eraser to clean anything in a radio other than the chassis. I've seen entire commercial systems destroyed by technicians and engineers "Cleaning" the edge connectors with pencil erasers and in the process sanded all the gold flashing and other plating off the flags which meant the cards had to be cleaned again and again with the evil eraser for ever not to mention the communications traffic outages caused by the now unplated connectors. This goes for switches and any other device that used a gold or precious metal flash for reliable low level continuity.
BTW RF attenuators can take on some odd configurations and mechanical nightmares to maintain low VSWR profiles and low attenuation blow by which may make any kind of cleaning problematic; that is the plating may already be worn off and any chemical cleaning may only give you short lived improvement. Good luck.

Bob, KE6F

Er, one small point. In Scotland (and no doubt many other parts of the
UK) there are villages where there were lead mines until the very recent
past.

The locals don't seem peculiar in any way; and the many tourist visitors
to the insides of the mines would appear to be there voluntarily.

Ah, you get that also. I recall ordering a bottle of Loewenbrau in
Atlanta 20 years ago and thinking I had received something from a bad
batch until I looked at the label and saw it was brewed here in the
states.

Caveat emptor.

> >>how very little fundamental knowledge is really NEW!

True, octane doesn't give a measure of raw power of 1 gallon of gas, but it does determine how much use a gasoline internal combustion engine can get out of it. If you try getting the same horsepower from two fuels of different octane, but gasoline all the same, you are going to fry or blow holes in your pistons, not to mention crack heads and blow cylinder gaskets, and even wrinkle rods and bend crankshafts. Detonation cannot be tolerated, so to up the power of a gasoline engine, you MUST run higher octane. Sure you have detonation sensors, but all they do is back the timing (aka power) off until a safe level of detonation is achieved. Detonation sensors therefore allow more power for a given amount of gas under certain conditions, but not that much. They are also required hardware in a turbo motor (gasoline types).

Later,

David

But turn production up to the level needed for enough batteries to keep the world in cars, and the small percentage margins from those mines will grow with the increased mining. Then you have processing, battery assembly, dead batteries that somehow missed the recycling center, etc.....

I'd much rather have a plutonium breeder reactor literally in my backyard (these are capable of supercritical bomb masses on meltdown, for the uninformed), than a lead anything plant 20 miles away.

If there is a good road, why not? Most luxury cars are built well here in the USA. If there quality isn't even always up to par, typically the power still is, and since Japan scared the crud out of the American manufacturers, America has even got its quality back up ....

Later,

David

In the case of the one I own, it's very reliable and starts first time after being locked away for many months (as I hope to prove again in early April) because it is a relatively simple engine compared with most modern petrol cars. Also mine is particularly safe and comfortable, and is neither noisy nor underpowered. I guess that Gary gave up on diesels without trying one with a turbo engine.

>Measure the individual plate
>currents under operation

Speaking as a beginner in the maintenance of the FT-101E (uses 2 6176's in parallel) and FL-2100B amp (uses 2 572B's in parallel) I inherited from my Dad's shack, what would be an easy safe way to separately measure the plate currents? The FL-2100B has a symmetrical, uninsulated doodad for attaching to the plate terminals - other than just putting an ammeter in line with the plate terminals, I suppose I could measure the voltage drop along the doodad for a couple of inches, either way I put my meter 2000 V above ground.

I'm not so worried about exposing it to the 650 V inside the FT-101 but there's got to be an easy trick all you HV homebrewers use to do this ...

Thanks in advance,
-Wiley KF6IIU

The information posted above is not correct with respect to the AEA data products.

The following information is correct:
In April 1997 Timewave Technology Inc. of St. Paul, MN acquired all the rights to the data product line of AEA. Tempo Research acquired the antennas and antenna instrument line of AEA, as well as the AEA name. Timewave has the right to use the AEA name for one year from the purchase date. The model names of the data products (PK-12, PK-96, etc.) are the property of Timewave.

The manufacturing rights for the PK-232 belong to Timewave; however, the PK-232 was not in production at AEA after early 1996 and it is not in production at Timewave.

The AEA division of TempoResearch manufactures and sells the AEA antennas and antenna instruments and can be contacted at the addresses and phone numbers shown in the W7CTW reply.

Timewave internet addresses and phone numbers are:

I justify the big engines because we drive big vehicles, and they need
that power to give them decent performance. As to the bushwa about
fossil fuel consumption and CO2 production, I'm simply not as alarmed
by it as you seem to be. Take a *hard* look at the science behind some
of this. It is shockingly shoddy and agenda driven.

>>a pair
>>of them go nicely under a 4x4 pickup (which our government just informed
>>us in a backhanded way is 25 times less likely to result in a fatality for its

>
>And maybe 50 times more likely to kill the guy you run into?

If he's driving some little crackerbox on wheels, probably. That's
his decision and his tough luck isn't it? Physics won't be denied.
It is not the fall that kills you, it is the sudden stop at the end. The
same goes in a collision. Big iron doesn't stop as fast in an impact,
even a rigid barrier impact, so the decceleration forces on the
passengers are much less than they are for a light vehicle. (A
very surprisingly *large* difference, do the math.)

The larger crush space and sturdier construction also limit
intrusion into the passenger compartment by external objects
intent on doing you bodily harm. If you choose to save a few
pennies in fuel consumption in preference to crash worthiness
and occupant safety, well I suppose that's your choice to make.
But there is a price to be paid for that choice, and that price is
yours to pay in blood.

>>There are good reasons why
>>we like to drive heavy iron besides the fact that it makes a wonderful
>>counterpoise for our HF antennas.

>
>For example, the penile extension syndrome?

There is certainly an element of macho in driving a 4x4
that never leaves pavement. But in fact mine does leave
the pavement frequently enough to justify it, or has to
operate on pavement slick enough to justify it. And it is
large enough to carry the loads I occasionally need to
haul, as well as big and sturdy enough to offer me a
degree of protection in traffic mishaps. Those are all
things which have to be balanced against operational
costs like fuel consumption.

I've owned the little crackerboxes. I've raced everything
from MX motorcycles to Top Fuel dragsters. I think I
understand the tradeoffs involved between agility and
survivability. And for my day to day driving, I've chosen
the big iron as best making the tradeoffs I'm willing to
accept at this point in my life. The hard fact is that you
can't avoid all collisions, no matter how good you are
or how agile your vehicle. Crashes happen. And when
they do, the vehicle you chose can determine whether
you walk away with a few bruises, or whether they have
to pry you out of the tin can and spread you in the
coffin with a pastry knife.

Remember your friend Kirchhoff. Current is the same all the
way around the loop. You want to measure it at a point where
the potential to chassis (and to you) is low. The place to do
that is in the cathode circuit.

Now I do believe that both of those pieces of equipment
already have current metering in the cathode circuit. So
you don't need to insert another meter. To use that meter,
you have to disable one of the tubes. Then the meter is
only reading the current in one tube. Reverse the process
and disable the other tube and you can read the current
through the first tube.

Now you can disable a tube by either biasing it into cutoff,
or simply removing it from the socket. The latter is probably
easiest. Observe all safety precautions. Make *sure* the
power is off, and discharge the power supply capacitors
before poking your hand in there. (Don't forget that the
tube will be hot either.)

What you're measuring is static current, don't apply RF
drive with a tube disabled.

>billions of sqaure kilometres. Some farmers in the highlands and lakes
>are still not allow to sell lamb because of the high levels of Strontium
>90 in the meat, caused by Chernobyl fallout.

TMI proved that our plant designs are safe, even in the face of the
operators doing exactly all the wrong things for 48 hours. The Detroit
Edison Fermi plant meltdown was even better proof. That was a total
core melt, not just some core cladding damage. Not one person
was injured. What Chernobyl proved is that you don't build a reactor
with a positive void coefficient and then call a tin roof a containment
structure.

Low grade waste can be dealt with by concentrating it into high grade
waste. The entire amount of spent fuel used by the world's nuclear
programs to date could be held on a football field stacked to a depth
of 4 feet (though that wouldn't be a great idea to actually do). If you
throw in all the waste from other sources from day one (except weapons
programs), including dismantled decommissioned reactor plants, it
would still make a pile smaller than the ash pile generated by *one*
1000 MWE coal fired plant in a year. The volume of waste is simply
not huge. Virtually all of it could simply be piled in a desert and have
a fence placed around it without any serious consequence. The
greatest bulk of the high level waste is short lived radioisotopes.
In 100 years, its activity is down to the level of the ore originally
dug out of the ground. It is not necessary to isolate it from the
environment for all time.

>Your latest government is pretty much of the same.

Right. The US isn't going to agree to anything which makes us
non-competitive for no good reason. We have a high energy society,
and that is our advantage. We aren't going to give it up without
overwhelming proof that not doing so would be devastating. So far,
the proof isn't even self-consistent or mildly compelling. Much of
it is downright dubious speculation.

>Instead of looking at nuclear/fossil fuels - we need to be looking at
>renewables, wind/wave/tidal/solar/biomass. They all have their own

>CO2/NO2/SO2 emissions. No power source can at the moment be perfect but
>we can improve matters, it just needs co-operation and governmental
>agreements, something which does not seem to happen from your side of
>the pond

Renewables do have serious problems. The most serious being that
most of them are very diffuse. In the US, we have tapped virtually all
the hydro we're ever going to be able to tap. And much of that will be
lost in coming years as the reservoirs silt up. Hydro is best used as
peaking power anyway, and not as base load generation. It is rapidly
and arbitrarily scheduleable on demand.

Tidal power is very site specific as to where it can be economically
exploited, and we have few such sites. It is also intermittant. So it is
not suited to meeting our on demand peaking needs. If we allow it
to take up some of the base load, we have to throttle back our other
base load sources to accomodate it at the times it is available, and
that generally means that they will be operating very inefficiently.
Base load generation should generally be run flat out at its most
efficient output all the time.

Wave power is too diffuse to be economic, and too vulnerable to
weather. It is also too far from most of our continential demand.
We have some promising wind sites, but not that many. The bulk
of our wind energy resource is diffuse and irregular. It isn't suited
to meet base load, nor is it scheduleable to meet peaking demand.

A large grid can allevate the problems of wind being a diffuse and
irregular source by averaging the resource over a large area. But
such a grid is very unstable and very difficult to manage and
control. As long as wind provides only a tiny fraction of the grid's
production, it can be managed. But if it starts to become a significant
supply source, the grid becomes very unstable and subject to
wild surges. That's particularly true when major storm fronts
pass through our prime wind farm areas, as they do regularly.

Solar suffers from LOLI (nuke speak for Loss of Light Incidents).
When we need power the most, at night, solar fails us. It is also
a diffuse resource, requiring vast stretches of land to provide
serious amounts of power. But it is perhaps the best of the
available renewable energy sources. All the other renewables
ultimately are secondary solar energy. (Actually, renewable is
a misnomer, the nuclear fusion supplying the energy isn't
renewable, but it is for practical purposes virtually inexhaustable.)

Right now, gathering solar for grid power simply isn't economic,
but that may change with improving technology. Storage will be a
necessity, however, due to LOLI. Pumped storage is perhaps the
best we have available for this, but it is very environmentally
unfriendly.

Biomass is ultimately no different than fossil. It releases CO2,
and a host of other pollutants, which are not immediately
recycled or neutralized. And in some cases biomass doesn't
even represent a net energy gain. For example our gasohol
program, which fermented and distilled corn to make fuel
alcohols to be blended with gasoline, wound up being a
net fossil fuel consumer due to the use of petrochemical
fertilizers and fuels needed to grow, harvest, and process
the corn to alcohol.

I note that you haven't touched on one of the more promising
alternative energy sources. That's dry geothermal. The resource
is huge, and we have the drilling technology to tap it. It is non-renewable
in the sense that the nuclear fission which powers it is not breeding
more fuel, but again, like solar fusion, the fission resource is extremely
large and for practical purposes inexhaustable. Dry geothermal is a
promising source of base load generation.

But we will still need large central generation plants that are fully
scheduleable and able to meet base load demands. The best
technology we have for that is the nuclear fission generating
plant. It is the cleanest and lowest cost source of electrical
power we know how to produce. (Actual costs, not politically
imposed hysteria costs.)

> given me good service. Time for a refit.
>

Before you do that. find out why one is dark. I assume you don't mean
the filament is burnt out. It could be something as simple as a bad
joint or contact in the supply to the filament that is causing a volt drop

and thereby reducing emission. Another possibiliy is that the RF drive
is unbalanced.

Unless you are after that last ounce of power, does it really matter if
one
valve is pulling less weight than the other?

For a new pair of 3-500Z - go to RF parts. They will cost you $200, that
is a good price, but it is still $200 you have to pay.

They would cost me $340 because they won't ship their own brand outside
the
USA and we pay a lot of tax. I also have one 3-500Z brighter than the
other.

Source record: 85727

Does anyone have a supplier for the RCA DSS offset dish (TV). I would like to use one to build a parabolic reflector for 10 GHz.

The ARRL Microwave Projects Manual (II) lists them at being available for about 13.50 $US, but gives no addy. Any ideas???

Paul
N3PEE

"But for every one of the liberated prisoners, the day comes when, looking back on his camp experiences, he can no longer understand how he endured it all. As the day of his liberation eventually came, when everything seemed to him like a beautiful dream, so also comes the day comes when all his camp experiences seem to him nothing but a nightmare.

"The crowning experience of all, for the homecoming man, is the wonderful feeling that, after all he has suffered, there is nothing he need fear any more -- except his God."

2275. Antenna Tuner Parts

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-26 00:00:00 UTC
From: am609@yfn.ysu.edu
Message-ID: <17F0974C6S86.TCNET058@ysub.ysu.edu>
Source record: 85728

Recently I have been considering building the W1FB SPC antenna tuner described in the ARRL Radio Amatuer's Handbook. The air variable capacitors are not so easy to find along with a good roller inductor that can handle the full-gallon without getting warm enough to fry eggs. Can anyone reccomend where I can start looking for the parts? A lead to companies selling the dual-section and single section air variable caps would be appreciated. These parts seem to be on the expensive side and difficult to find.

73s and thanks,

2276. Info on Amphenol RF relays?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-26 00:00:00 UTC
From: Jeff Anderson <jeffa@ix.netcom.com>
Message-ID: <6d3qnc$gvf@sjx-ixn2.ix.netcom.com>
Source record: 85729
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I need an antenna T/R switch for my SX-117/HT-44 pair.
I just dug a couple of RF relays out of my "relay box," but
I don't know their contact ratings, and I can't find any
additional information about them.

They are both Amphenol (or Amphenol Bunker Ramo?)
relays, with the following part numbers:

300-10519
300-10004

They both have 26 vdc coils and BNC connectors.

I found some similar (but not identical) relays in
the Surplus Sales of Nebraska catalog, and as near as
I can tell the ratings are either 50, 100, or 300 watts,
but I can't tell which.

Any additional information on these relays would be
very much appreciated.

Thanks,

- Jeff, WA6AHL

yah. Expensive. Hard to find? Only if you want inexpensive. But it is worth looking. I have a bunch of Osc Tuners out of a BC-375, that I want $75 for, each. Last time I said that on this NG, someone else said they had been to a place where the owner would almost pay them to haul the stuff off.

Look around. those tuners should provide most of the parts, and the roller inductor from a BC-375 should handle a KW safely. that was a field-rugged, sea-rugged military unit that had to stand up under fire.

I cannibalized mine, and the final tank is out in the shed, but It AIN'T for gimmies. Get used to KW stuff being expensive.

But if you got time to look, hunt for BC-375 radio parts.

Good luck.

2282. How to measure Z of small transformers

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-26 00:00:00 UTC
From: jjknap@skcla.monsanto.com
Message-ID: <1998Feb26.104123.1@skcla.monsanto.com>
Source record: 85735

Does anyone know of a way to measure the impedance of small interstage-type transformers? Ive tried using a voltage divider technique: Apply a 1khz sine wave in series with winding and a pot. Adjust pot for equal voltage drops, then measure resistance of pot. However it seems the impedance measured is more a function of what is reflected from the other winding. (ie if you put a load on the other winding your measurement changes a lot) any ideas?

Thanks,
Jerome KNapp

http://www.mcmelectronics.com

For that price range though, you get the dish only, no mounting
bracket, or feed horn bracket.

Good luck.

Hi
I have the 141T mainframe and a 8553B RF unit. But I would love to
have the IF 8552 A or B and the 8554 RF unit.
But spending 1k dollars on an obsolete instrument that might take a
dive beyond repair is not really tempting. So if any of you out there
have old functional units I am intereseted! But the price must be
right. The looks does not matter, scratches or missing knobs are of no
consern. Even some malfunction might be ok as I have full
servicemanulas for all plug-ins.

Any offer???
Lasse

Ah! I knew that what once was the xtal arm of ITT plant was still
on the go, but didn't know their new name. I certainly didn't know that
the folk from SEI had moved there. I suppose Dave Standring and Ron
Pallister must have retired some time ago.

Taking a scan over my drawers full of crystals will reveal roughly
equal numbers marked ITT, SEI and CCL.

Does anyone know what happened to the mag cores side of SEI? that
power meter I did for the G-QRP club used a couple of their toroids.

Cheers

HAMFEST March 8, 1998 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB & SUFFOLK COUNTY RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST-COMPUTER SHOW - MARCH 8, 1998

LINDENHURST, LI - NY

On March 8, 1998 the Great South Bay Amateur Radio Club & Suffolk County Radio Club will again sponsor an indoor Hamfest-Computer Show. The location Will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.

This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and accessories, software, books, technical manuals, ARRL information, Amateur Radio License Exams and information. Door Prizes. General admission is $ 6.00. $5.00 with coupon. (Coupons will be available at the door.)

ARRL VE - 12:00 NOON
For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam session. 1998 ARRL/VEC fee is $ 6.35, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

For vendor and additional information pleas contact, Tom Favilla N2MIG at (516)957-5985, during EVENING HOURS (7PM-10PM), or info@gsbarc.org
NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available. Tables are 2.5ft x 6ft.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is available during the club 2-meter info net:
GSBARC-Monday at 7:00 PM on the W2GSB repeater, 146.685 -600 4Z(136.5)PL.

Hello All,

Looking for your best suggestions on an in house wire for HF, would like to work atleast 15, 17, 30, ??40?? Meter. Will be 5 watts or less, looking for least RFI, Most help in making a qrp antenna restricted contacts..

Thanks,
Jim

The flux depends on the current and the number of turns,
not on the voltage. And the current in the primary (of a reversed)
transformer (or any other) depends mostly on the load placed
on the secondary.

I wouldn't be surprised if the max power rating is reduced
by reversing a transformer, but the original poster wanted
only 25 mA, and that seems small, so it seems to me
there is a good chance this would work just fine.

If it was me I would hook it up and see if it got hot.
It will be obvious right away, and you can turn it
off before it gets cooked. An ammeter in the primary
would show the problem instantly.
Nothing beats the empirical method for resolving disputes.

2295. rf design problem(impedance matching)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-27 00:00:00 UTC
From: workshop@pcm.co.za
Message-ID: <6d6q7k$g74$1@news01.iafrica.com>
Source record: 85548
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.homebrew,uk.radio.amateur

Hi to all.
I am trying to design an impedance matching cct to match a 50 ohm source to the input of a mrf234 transistor.The spec sheets show that it's input (series) at 100MHz is 1.5-j2.7 ohms.This shows an input capacitance of about 590pF.
Using the formulas for an L- network (from C.Bowick RF design) the value of the series matching inductor is in the region of 18nH.This is a pretty small value to work with. (I posted a question about low value inductor design a few

days ago-thanks to all those who replied.)

Now the Question!

Would it not be possible to put a small capacitor in series with the transistor(base) before the inductor.This would in effect lower the input capacitance of the transistor and hence the value of the inductor could be increaced to a more managable value.
I am using Motorola's MIMP (Motorola Impedance Matching Program) program and my idea models ok,but would it work in practice? The values that bring a match

,working from the source are: 183pf (shunt) ,82 nH (series) , 39pF (series) to

the input of the tranny.

As you can see an 82nH inductor would be easier to come up with and provides more tolerance.By fiddeling you could increace the inductor value even more.
The model also works in Pspice,but pspice can come up with some pretty interesting things if you are not careful.

Hope I have not been to vague.
Any help app.
Cheers
Rob.

One way to approach this would be envelope elimination and
restoration - split the incoming SSB signal into amplitude and
frequency components (envelope detector and heavy clipping,
respectively), feed the constant amplitude frequency
bits through your Class D/E/F amplifer, and add the envelope
back in. I've never heard of hams playing with this. It's on
my list of things to look in to someday.

There is information in Sabin (_Single Sideband Systems &
Circuits_). Maybe also check the satellite references on
HELAPS and related technologies?

A recommended book is "Practical Transformer Design Handbook" by Lowdon,
which was published by Sams or (later) by Tab Professional Books.

The design impedances don't easily relate to what you can measure
on a transformer. What you can measure are the turns ratio and the
winding inductances. You can get a SWAG of what the tranformer is
by measuring the inductance of the winding with the most turns and
figure that this reactance at the highest frequency you want to use
will be about 10 times the rated impedance. Measuring the inductance
of the windings can be fun if one of the other windings forms a resonant
circuit with its winding inductance and capacitance. That reflects all
sorts of strange stuff back into the winding you're trying to measure.
That's why it's easiest to use the biggest winding.

What? Have you ever been to Leadhills?

Many hundreds of miners and their families died from lead poisoning and the lead fumes from the smelters polluted the areas for miles around the plant. In fact some of the smelters still exist because the lead has leached its way into the wooden building in such quantities that it will not rot. The local watercourse is heavily contaminated by lead sulphide and in most places around the site; lifeless.

The expose now is probably minute, the ore is not mined now (although there are tonnes of ore left - supply/demand price too low for mining it) and so the Galena is not being spread about. The smelters are no longer running and so lead fumes are not being produced, so of course the locals look OK. But their ancestors were far from OK.Most died very premature and quite nasty deaths, brought on by lead poisoning.

Actually "obsolete" is in the eye of the beholder. For HF work in particular, you can spend $20K and still not get the narrow bandwidths and sweep spans that an 8553B offers. Newer SA's are a great deal easier to use (they have microprocessor-controlled auto-setup; they don't drift out of phase lock every so often; they have digital storage; etc., etc) but as far as the important fundamentals go, they don't really do anything the old HP or Tek models can't do.

Plus, as long as junked parts units and manuals are as cheap and common as they are, there's really no such thing as "beyond repair."

Thanks Roy. Got the TX going. No RX, but lots of audio feedback. Rebuilt the mixer, using FT37-41s 15 trifilliar, diodes going into 2 windings, centertapped. It worked, but not that great, also still squeeling. Put in an SRA-1 mixer, and got instant improvement, still squeeling.
I noticed that some parts in the audio section were up off the board, so I pushed them in tight, and the microphonics got better. Shielded the power leads and put .01 caps across V. in and audio out. No noticable improvement.
It works OK, except I get distortion above 20% gain. Like something is being overdriven.
I was told the first audio chip is an active filter. I guess the 2nd is the AGC, and the 3rd the audio PA.
So, should I cut the input to one of the chips?
Thanks,
Lon, KB3BVY
P.S. Might have been easier to build a new one, but I wouldn't have learned as much.

Yes, current limiting needed when you connect a very flat (say zero volts!) chargee to a 13.8 V chargER. I use a 60 watt headlamp bulb; when it's dim the current has dropped of course. If it went out entirely you could assume the rate of charging is now so low that the chargee is "full" but I've never tested this thought by measurement - I tend to stop developing ideas once they work, and I don't always wonder how to explain them, either. (The opposite of what I was taught at Uni and much more like what I was taught by the Air Force.)

I read that to trickle charge a lead acid cell (PER CELL) you need 2.25 to 2.30 V; that's TIGHT regulation. And to charge "cyclically" (i.e. let it get flat before charging, rather than keep it topped up) you need 2.40 to 2.50 V/cell.

It is also recommended (Maplin catalogue I'm quoting here) to restrict the current to 0.25 of the rated capacity of the battery, eg for a 10 Ah battery, don't charge faster than 2.5 A (and incidentally it won't be QUITE full after 4 hours but I'd gang warily after that.)

CAR TYPE BATTERY CHARGERS MUST NEVER BE USED. I expect they say that because there's no regulation in such items. Initial current can be V high and there's nothing to prevent overcharge. (You would not use a car type battery charger for very long - usually just until you can get a start.)

An occasionally useful trick is to leave a car idling and connect a flat (12 V car) battery caross it, + to +, with jump leads. The flattie will soon be OK to give another vehicle a start. BIG RISK of SPARKS NEAR PETROL (GAS) FUMES HERE. You have been warned.

Sounds sort of like an amplitude modulated, electromagnetically coupled
system. I suppose its AM instead of something else because LOTS of power
is applied and baud is low- and AM is nice and simple.

Gregm

marc_k@walrus.com (marc_k) writes:
>So let's say that the poster has a regulated 13.8 volt at say, 3 amps.
>I would tend to assume that some current limiting would be needed??

Yes. The most conservative spec I've seen is to set the current limit at 0.25 C. So if the battery is 7 Ah, the current should be limited to 1.75 amps. Some manufacturers specify 0.4 C instead, but you'd need to find the data sheet for your particular battery to be sure of that.

The voltage limit should be set to 13.8 V max if you are doing "float" charging. It will take longer for the battery to reach full charge, but you can leave it connected to the power supply forever without damage.

You can use a higher charging voltage, up to about 14.7 V, to get faster charge times. But when the charge current drops to almost nothing, you should disconnect the battery from the supply - if you leave it connected you'll eventually damage the battery through overcharge.

There are also specialized charger chips. I've used a GA8532P as the heart of a lead-acid charger. It will supply current-limited power to a discharged battery until the voltage rises to 14.7 V. Then it maintains a constant voltage while the current naturally reduces. As the current drops below some (user-set) threshold, the output voltage is reduced as well until it reaches 13.65 V at low charge currents.

In practice, the charger runs at the current limit for most of the charge period. Then it holds the high charging voltage for a while. Then there is a period where sits at the low voltage most of the time, with occasional pulses of higher voltage. Then, finally, it sits at the lower voltage float charging all the time.

You get the best of both worlds. As long as the battery will accept plenty of current, the charge voltage is 14.7 V (or whatever voltage gives maximum allowed current, whichever is less). This gives the fastest possible recharge (within the current limit) up to about 90% full. Then the voltage is dropped back to 13.65, where it is safe to leave the battery connected forever. Of course, you can use exactly the same strategy with a bench power supply, but you have to watch the current and adjust the voltage manually.

One further consideration: What happens when the AC power fails with your charger still connected to the battery? In the case of the GA8532 circuit, it has been designed for this possibility. There is no damage to the charger circuit, and the discharge load on the battery is

microamps. I have a commercial 13.8 V supply that also seems to have no reverse current flow and no damage when the AC power fails. But my bench power supply will at least discharge the battery (it has a resistor across the output terminals) and might be damaged if battery voltage is applied to the output with no AC input power).

>The flux depends on the current and the number of turns,
>not on the voltage. And the current in the primary (of a reversed)
>transformer (or any other) depends mostly on the load placed
>on the secondary.

I'm talking about the magnetizing current, not the transformed current. The primary and secondary flux from the load current cancel in the core. But the primary winding must have enough inductance so that the magnetizing current is quite low when there is no load on the transformer.

As the applied primary voltage is increased, the amount of reverse EMF that has to be generated by this inductance also increases. That requires more magnetic flux in the core. As long as the core isn't saturated, the magnetizing current automatically increases, the reverse EMF increases to balance the source voltage, and everything is OK.

The core of a transformer has enough iron to avoid saturating with the rated primary voltage applied, plus some safety margin. But if you increase the voltage too much beyond rating, the core saturates, the primary inductance drops, the magnetizing current goes way up, and the transformer gets hot. All with no load connected.

>If it was me I would hook it up and see if it got hot. >It will be obvious right away, and you can turn it >off before it gets cooked. An ammeter in the primary >would show the problem instantly. >Nothing beats the empirical method for resolving disputes.

Even better, use a Variac. Slowly raise the voltage above the rated value. If the primary inductance remains constant, the current will be proportional to applied voltage, and so the current will go up slowly but gradually. If it increases suddenly, something unhealthy is happening - probably core saturation.

Hi Phil and David,

Since Class E amplifiers are inherently non-linear (hence high
efficiency), they are useful for modes requiring no linearity, such as
CW and FSK (or FM). For me, that meets the entirety of my operating
modes, HI!

Hi Jody OM,

The impedance of a driven element in a parasitic (Yagi) array
is usually well under 50 ohms, depending on the spacing of the
elements. Close-spaced yagis (less than 1/8 wavelength or so),
have much lower resonant resistance, sometimes under 10 ohms.
This is the reason for using matching devices such as a gamma match,
to raise this low level of resistance up to 50 ohms to match typical
transmission lines. All this is covered in any ARRL antenna book.
I suggest you first undertake a little study of readily available
literature and you should be well equipped to build your beam. ARRL
handbooks are often in libraries, so don't buy one if you can avoid
it (our library here, in a town of 6K, always has the latest copy
of the ARRL Handbook, which contains yagi antenna information). For
the price of a handbook you can likely purchase most or all of the
required materials from metal salvage yards.

I looked at the caltech web-site mentioned below for 350-500 W amp.
Could not helpwondering about the following points:-

1. What DC supply voltage is used to power these AMPS.

2. HOW come these things will work fine with 2 WATTS of drive and
provide 500 WATTS out ? Dont these things self-destruct from RF
feedback?

3. How stable RF wise and thermally are these things ? DO they use
some neutralization techniques to get high RF stability + a lot of
power gain as they claim. (the Gate to DRAIN cap of IRFP is 340 pF).
Or do the use a really LOW impedance drive source to provide the
gate drive and yet remain stable thermally?

Hellow to everybody !
My name is Steve, and I am an electronics student. About a week ago, I got for 40 $ an analog proto-board made by Global Specialists, New Haven ,CT 06512. The model number is PB-503. Unfortunatelly it came with no power supply. I called the company and they want 43$ for just the supply which I don't have !!! If someone knows about this boards or is using one can you please tell me what are the voltages that go to the 5 pin Din-connector. actually 4) I think I can somehow put a multiple power-supply together for a lot less than 43 $. Any help will be greatly appreciated !!!!

Calling all elmers...

I've been away from the hobby for some years now but have once again been bitten by the bug. I've always operated QRP CW-only and would like to continue my quest. I have however opted to set aside the old direct conversion rig for something better. Being a homebrewer at heart, I can't bring myself to pay good $$$ for a commercial rig and would like to construct my own. Can anyone recommend a nice HF receiver kit or design. I've not see an ARRL handbook in 15 years. Maybe I'll pick one up and see what I can find there.

Any and all suggestions appreciated.

>>buying and servicing diesels?
>>
>>73, Bob, VE7HS

>Why not? If the fuel is cheaper and the engines available.

Because the fuel ISN'T cheaper, and the engines are more expensive to buy
and service. Opting for diesel simply isn't cost effective. Here, anyway.

73, Bob.

Ivor,
Without doubt, the American who replied is confusing Beer with Lager!
Lager needs to be drunk cold, but as for Beer, esp. Real Ale as you stated,
it's optimum temp is nowhere near that of Lager.
A nice pint of Dogbolter would go down fine right now!

Alan

>
>Thanks,
>Jerome KNapp
>jjknap@skcla.monsanto.com

That's a good question. There are two factors you need to measure. One is the primary:secondary impedance ratio. Do this by exciting one winding with a known amplitude audio sine wave, and measuring the resulting amplitude at the secondary. The impedance ratio is the square of the ratio of amplitudes (turns ratio).

The second thing you need to measure is the shunt winding impedance. This is essentially what you're doing now. The shunt winding impedance has to be several times greater than the impedance of the circuit connected to it, because it appears in parallel with the connected circuit. For example, a 50:1000 ohm transformer should have a primary shunt impedance of, say, 250 ohms or higher. (I don't know what shunt:load Z values are commonly used in the design of small audio transformers, but would guess it to be around 5:1.) If you try using the transformer for circuit impedances much larger than this, the shunt winding impedance will load the circuit, which is undesirable. I don't see any problem in using the transformer for lower circuit impedances, unless they're so low that the winding resistance becomes a problem.

>Jody W4TDY

The impedance isn't the same for all beam antennas., The resistance is typically well below 50 ohms, say 20 or 25, and the feedpoint impedance can also include quite a bit of reactance if the driven element isn't adjusted to resonate the antenna. If you don't match it, your transmission line will have a fairly high SWR. If you're not running a lot of power, if your rig doesn't mind the SWR, and if the transmission line has low loss (i.e. is short and/or the frequency isn't too high), the mismatch won't be a problem. Otherwise, you'd best match it. A gamma match is most often used for this purpose. See the _ARRL Antenna Book_ for information on building and adjusting them.

A gamma match is nice and not too difficult to make. You didn't say what frequency this beam is going to be. If you can get your hands on a MFJ 259 to show you what is happening when you make adjustments - it will be fairly easy. Good Luck Walter

> rick@area.com

Well, having trouble-shot several 141T RF plugins myself recently, in my experience they are actually more bulletproof than you might imagine. The #1 problem I have seen (in 3 out of 6 plugins, no less!) is a lack of spring tension or general mis-positioning of the D-sub connector that interfaces the RF plugin to the IF section. That is the first thing to check whenever a 141T is giving you trouble.

What tends to happen is that despite your best efforts to seat the D-sub connectors properly before locking the plugins together, the coaxial subconnector that transports the IF signal to the 8552 isn't mating completely with its counterpart on the IF chassis. Consequently, the plugin may appear to work properly, but everything you look at is about 50 dB down. :-) This can lead you to believe, falsely, that you have hosed your attenuator or mixer.

If your 1st LO feedthrough appears suppressed to the same extent as an actual signal, and you know the mixer hasn't been nuked (i.e., it used to work but quit for no apparent reason), then the attenuator is not the problem. Chances are, the IF feedthrough connection is all that's wrong with your plugin.

I recently "fixed" two otherwise-mint 8554B RF sections simply by bending the D-sub connectors' mounting fingers out slightly with a pair of pliers. On one of them, I added an extra flat washer underneath the flange nearest the IF passthrough connector, just to be safe. They both work great now.

Even if the attenuator is blown, most people give up way too easily on these things. There is nothing mystical about an attenuator. The 8556A and 8553B attenuators would be trivial to repair or rework, due to the low frequencies involved. Even the rotary attenuator on the 1250 Mhz 8554L/B would probably not be too hard to fix with modern chip resistors and a steady hand on the soldering iron. Only the 8555A attenuator, which needs to be flat to 18 GHz, is truly beyond human help. I haven't seen any bad attenuators on any plugins except the 8555A, though, so can't speak from experience. (I do have a nice HP8656A 990 MHz signal

generator whose life I saved with emergency attenuator surgery, though!)

All of this being said, if you really do have any basket-case 141T plugins that you want to sell cheap, I'd be glad to buy them from you for a few bucks each plus the shipping charge. Those things are a regular gold mine of RF parts.

Because they also happen to be loads of fun, never mind the fact that alot of those big engines put out "safer" exhaust than the cracker box engines found in smaller European and even some American cars of non-American decent. Sure, a Geo Metro puts out less exhaust than a V10 Viper, but the exhaust out of the Viper is more than likely ALOT safer to breathe directly. This fact is commonly ignored by the "environmental" division of American politics. If they only knew what technology does, and how it works, and what it is capable of.

I guess that is too much to ask for,

David

Whilst we all lament the loss of Cathodeon and SEI in many ways the
biggest loss is HP crystals / oscillators I notice that the 105? OCXO
now changes hands at a premium price and someone suggested scrapping old
HP counters to get the OCXO. Whilst with HP Don Hammond was one fo the
few who could visualise Quartz temperature coefficients/ for 2
simultaneous quartz angle of cut orientations. He also was responsible
for the LC cut that had significant advantages over platinum for
temperature measurement another instrument greatly missed..
The contraction of the UK quartz buisness has been going on for some
time SEI incorporated the technology that came from Marconi Hackbridge
where I did the first? low power TO5 oscillator within a vacuum for
insulation.

I turned on my computer connected to internet and browsed through the
messages on this NG before doing anything else. I got a little
suspicious when I read the title of the message, and checked the disk
for possible a virus - and found one!
Of course, I am not 100% sure that this NG was the source, I wish I
could always be sure where these damned things come from.
Anyway, I thought that a warning would be right.

Best regards,

Arnold Goks&#65533;yr

Not really. We had a message store-and-forwarding system, and that's
about it. The opportunities that a real network provides are
substantially greater - digital voice, video, web access, etc.

There is no way to get a virus from a newsgroup or email message, unless the message contains an attached executable file and you go out of your way to run it.

You already had the virus. FORM is probably the most common virus in existence, because it's harmless and therefore not responsible for killing its host. It's transmitted by booting infected floppy disks. Usually this happens when you accidentally turn on your machine with an infected floppy in the drive. By the time you see the "System not present, insert master disk and reboot" (or whatever) message, your hard drive is already infected.

Most of the family cars here in California are 4 wheel drive utility vehicles or 4 x 4 pick up trucks and easily capable of climbing a small 3000 feet hill. Sixty percent of new car sales are now this type of vehicle. These vehicles get wonderful gas mileage, anywhere from 12 to 20 mpg. They are also much safer to drive, you can actually rear end someone in a compact (comparable to a full size UK car) vehicle, drive over the top of them and continue on your way with out too much trouble. You pay the same insurance rate as on a compact vehicle, so all in all good value for money. There is also plenty of room for an array of Ham Radio equipment and antennas. I added the last sentence just to be legal in the news group. To post to this group I think that one should be required to mention something about radio, no matter how trivial or remote this may be.

I am trying to find a couple of relays.

First is a Schurack DPDP 12VDC RA4D012 (RA402012) Plastic plug in type

Next is a time delay Amperite 6NO75T 9 pin plug in.

I have a new in the box 12NO06T but need a 6 volt one instead. These go in a Detron MLA-2500 amp.

Any idea's where I can get these.

Thanks

Why convert the tube type just to put it on 6 meters? The 8875's run like gangbusters on 6 and are cooled transversly while the 3CX800 is radially cooled, isn't it?

Or am I reading something between the lines that isn't there? Maybe like you have access to 3CX800s and not 8875s?

FS: Video C mount B/W board Caneras & CH27 xmiter
I have 3 Video C mount B/W board Caneras with 16mm lenses
that I bought from BG Micro. The cameras were $59.95 each
and the lenses were $19.99 each. They are new, never used
or opened. Board size is 1.5" X 1.5"

I will sell the cameras with the lenses for $40.00 each or
all three for $100.00

I also have a UHF transmitter that has a range of about 100
feet and is crystal controlled on TV channel 27. It will
do color or B/W and sound. It has a 12 VDC input jack or will
work on a 9 volt battery that fits in the case.
It is 1.25" high, 2.75" wide, and 3.75 deep. $30.00

Shipping is extra. I'm in Roseville CA 95678

P.S. I'm looking for color board cameras, wide angle. Trade?

You may wish to pick up a copy of "Solid State Design for the Radio Amateur" by the HQ staff of the ARRL. This book, though 25 years old now, has some excellent design philosophy in the "Advanced Receiver Concepts" chapter, as well as some fullblown receiver plans toward the end. Most of them can be inexpensively constructed while yielding high performance.

>Tnx for feedback.
>
>Phil G4ZOW

There is a current path from the inside of the coax shield to the outside. Depending on the coax length, the antenna impedance, and the overall path to the earth, the amount of current along the outside of the coax can be large or small. This current radiates, so in a Yagi installation, it can degrade your front/back ratio, and add some vertically-polarized signal. In addition, if the current is large, the current can couple into nearby telephone lines, TV feedlines, etc., aggravating interference. The feedline becomes part of your antenna.

You might be lucky and have a length of coax that results in very little current. On the other hand, you might not.

For this reason, I recommend a "current" or "choke" balun. It can be made any of several ways, including ferrite cores along the outside of the coax (W2DU style), "air core" (coax wound into a coil of some sort -- see the ARRL Handbook for recommended dimensions), or several turns of small coax on a ferrite core. If properly implemented, it won't do any harm, and will insure that the magnitude of current on the outside of the coax is small.

I've written more about baluns in "Baluns: What They Do and How They Do It" in the ARRL Antenna Compendium, Vol. 1.

Right! I always read the label. Latest best lager was
Tiger from Singapore. Imported. Best continental lagers
are Kronenburg 1664, Stella, Staropramen (or any genuine
Czech lager), Zipfer, Stiegl. Kronenbourg and Stella you
have to be very careful about as they are brewed in England
without hops and are as tastless as English bitter.

Hi,

I just went to a great deal of trouble to install a single ended zep and
I cant seem to tune the antenna.

I have the antenna connected to single ended Zep which is 63 feet long
fed by paralle conductor feedline. Now all I get
out of my rig is an annoying oscillation.

Any suggestions.

Chip

Leider nicht! Ich habe nur diesselbe Artikel in deutsche Sprache
(UKW-Berichte).
The only particular difference for this power amplifier compared to most
other is the use of a high voltage coupling capacitor between anode and
the tuned (and grounded) output circuit.

Yep, move the feedline to the center of the halfwave dipole and make the
feedline a multiple of half-wavelengths long at the resonant frequency.
You need a very good ground to get an SEZepp to work on land. BTW, is
this for transmitting as well as receiving?

I just made some comments about converting cb sets to 10meters in rec.radio.amateur.misc this week, in answer to someone's question. It might still be unexpired at your site.

If you're talking about buying a new CB set today and converting it, it was my understanding that at some point the design (in general) was changed so that it was difficult to convert. The early PLL synthesized rigs were fairly easy to change frequency, and apparently there was a concern that some might change them to somewhere they shouldn't (ie CB'ers moving them to a completely illegal band). So their design was changed, and it was harder to move them to a new frequency. This is not first hand knowledge, but I do know that while there were plenty of articles about converting those early PLL CB sets to 10meters, they stopped after a certain point.

If you want to make a beacon, a CB set that uses a crystal to set the frequency can be used by simply changing the crystal and perhaps tuning things up a bit. Are such CB sets being sold nowadays? You used to be able to buy them, and they'd come with one channel installed, and a switch that allowed for a few more channels.

You might do well to look at fleamarkets and garage sales. I found a couple of CB sets in the neighbor's garbage one time.

Of course, once you start needing to track down a crystal and modify the set for use as a beacon (I presume they use cw), it isn't all that far from building a small 10Meter beacon from scratch.

Your analogy doesn't hold alot of water (pardon the pun). You already have a much greater chance of falling down and breaking your neck while pouring yourself a cold one than dying from exposure to nuclear radiation from a well designed plant. Sure, there is always some way for all the wrong blocks to align themselves in anything, and thats my point, and why I used the term "almost 100%". Just as there are aliens controlling our minds, the plastic eraser on my desk could suffer spontaneous quantum deconstruction, wiping out 13 or 14 city blocks, or even more unlikely, American amateurs will have a high speed nationwide packet switched radio network :-) (couldn't resist). You shouldn't always place your bets on the "sure win" or you'll never progress. There is chance involved in anything.

IT IS SIMPLE TO CONVERT the CB to 10 meters. There are various Web sites

that sell CB radios(export models) cheap or regular CB radios for
$135 that include SSB that you simply hold down a few buttons and
now the radio transmits from 25 to 29.9999 MHZ. One brand is "CHEROKEE".
Go do a search under ALTA VISTA and go to the Web sites and links.
Also, you can get CB amplifiers that put out 225 watts PEP for $99 at
several of these places and the AMP in the Pictures look WELL BUILT.
They even have 5 pole Chebe.... Filters for lowpass at 53 MHZ. Yes, they
are advertised as 10-80 mtrs but work on 6 mTRS TOO!!
I am myself considering doing this as a cheap option to put out a decnt
signal from my car soonas 10 meters opens again. Yes, these CBs and
AMPs ar FCC approved to be sold in the USA for the 10 MTR HAM BAND.

And I quote from the GEET page:

"... some of the mixtures were done with mixtures with as much as 80%
water."

I wonder if anyone will ever realize that as much energy as is derived
from burning hydrogen and oxygen, it takes even more to separate it.
There never will be any magical way to do it with minute amounts of
power, or you would be tripping up physics as we know it.

In dream land, of course, the following would also be possible:

My next Camaro will get 1000 miles/gallon of water and do 60 in less one
second, and weigh over 6000 pounds to achieve that good ride all the
luxo liner buyers are looking for in a car. (and the US Amatuers will
have a high speed packet switched infrastructure nationwide :-)).

On the other hand, I do think hydrogen will be our future fuel
technology (after we have pumped every last existing drop of petroleum
product from our crust), but it will be separated at solar stations that
convert light to electricity and use it to desalinize and then decompose
sea water into H2 and O2. Those stations may even end up being powered,
not from solar cells on the ground, but satellites beaming down
microwave energy from collectors in space. It would be alot cheaper
than ground based solar energy collection, given that we one day achieve
cheap spaceflight.

Also, one thing the green planet enthusiasts don't consider, those
electrical cars that they so gladly will buy up when they become
available, will have synthetic lubricants in their gear boxes, motors,
and air conditioning systems.

On (Sat 28 Feb 1998) I had a QSO with UK Radio amateurs who
were happily sending packets to USA, to telnet to a group who included
a USA amateur who was in the same group - but using a regular ISP
internet connection!

It seems the guys who set up this "net" issue their own internet ID
number sets (the famous sets of digits separated by fullstops), except
the first number is 44 (instead of a 3-digit one). The "44" signifies
a amateur packet connection, and such an ID should not pass through
a server here as if it were a regular internet packet.

I tried telnet into this packet server, but I must have done it wrong.
My ISP accepted the address, but failed to connect. I freely admit
there is just so much I don't understand about how this is done. I
think that launching a packet to a US station by amateur radio
is unlikely to be illegal here, just because some other users of that
station happen to send their stuff via an internet route..

While this subject is interesting enough to roll up unusual numbers
of postings, I have got to admit that it is probably in the wrong group.
I'm not fussy or pedantic. Say it here if you like - but you may
expect some flak eventually from the net "hobby bobbies".

2394. Amplifiers for sale...

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-01 00:00:00 UTC
From: wizard@eskimo.com
Message-ID: <34f8ada3.3000249@eskinews.eskimo.com>
Source record: 85512

Amplifiers for sale.....

600W PEP, 400W continuous, wideband, class AB linear amplifier usable from 15-150 Mhz. Single drawer unit includes Kilovac COR switching, adjustable time delay, and accessory switching. Amp utilizes a wideband splitter/combiner combo, auto bias switching, thermal protection, and uses MOSFET transistors. Amp delivers extremely clean signal and is overdesigned to provide 100% duty cycle at 400W. Requires 28VDC @ 70A peaks for a power source. Asking $500 or best offer. I would also consider a trade for a solid state HF transceiver.

250W HF solid state base amplifier with power supply, receive preamp, and COR circuitry. $200.

100W Continuous duty wideband amplifier module usable from 400-1000Mhz. Capable of over 150W on 70cm. Requires 28VDC power source. Asking $300 or best offer.

If interested, please reply via E-mail at wizard@eskimo.com

>find an easy conversion to the 3cx800a7's or not.

Bob,
There was just such a mod in QST about 2 yrs ago. If you can find out
which issue it was in, you can probably download the file from the
ARRL's ftp site. At one time they had the whole article, plus
drawings and other things on there. Check on the ARRL web page or
drop one of the HQ crew a note and they can probably tell you where to
find it.

I had one of those amps, you have to be carefull with the 8875's but
other than that it was a pretty good little amp.

2396. 440 Tin Can Resonantor- need help

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-01 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <34F8CD31.AE14A8DF@lafn.org>
Source record: 85514

Hi,

I need some real help with trying to narrow the receive bandwidth of my HTX-404 HT for 440 operation.
I am looking for various low cost ways to reduce BW.

I just read the specs for TOKO helical filters from DigiKey web and the specs seem conflicting
for bandwidth and attenuating skirts, have large insertion losses, and seem complex to use.
I want to look at other approaches while I wait for TOKO info to arrive.

DSI of Canada makes a 440 to 450 filter that they say will do the job and help greatly.
$109 is too expensive for this experiment.

I read that cavity rsesonantors can help and can be made from food tin cans.
Are they practical for my application?

Can someone point me to some detailed contruction info so I can build a tin can resonantor for
receiving FM on 449.325 mhz? I am reading about them in my old ARRL Handbook. Handbook is very lacking in
details such as where to locate connectors and how to construct links couplers.

Commercial resonantors probably are too costly.

What am I trying to do?

I am trying to use my HTX-404 handheld to work Boeing FM Repeator on 449.325 located 40 miles from me so a friend and I can reduce landline phone costs. With a small linear amp, sorry not qrp, the repeator does hear me with my 440 vertical antenna; will change to a beam soon. My poor HT barely tolerates high gain antenna and cannot tolerate adding a GasFet preamp.

Since receiving is my biggest problem, I have been told I do not need any preamp ahead of HT but I DO need to
drastically narrow my receiving signal bandwidth.

I am open to any suggestions. I want to build whatever I can to cut costs, beam, tin can resonantors..?

Thanks for any suggestions.

>Thanks for any suggestions.

Dave, narrowing the bandwidth of your HT will not increase sensitivity. The only reason you'd want a filter in front of the receiver is to reduce intermod, IE pager crud, which your HT may suffer due to overload caused by using a better antenna or preamp. A pass cavity *can* do that, but it also introduces insertion loss. And a homemade cavity from a food tin would be particularly lossy.

A better solution is to identify the offending signals and insert a notch filter in the line to attenuate them while passing all other signals. DCI and PAR make such filters centered on the primary paging frequencies just above the 70 cm band. The insertion loss of this sort of filter is negligible.

You can also easily make notch filters using a coax Tee and a length of coax for the stub. Put the Tee in the line and hang the stub from it. At the frequency at which the stub in a halfwave (open) it will act as a notch filter. You can trim to length to notch out any offending signal.

That article was for converting it to use a 4CX800A tetrode in a
common cathode configuration. The information is on Svetlana's
website, www.svetlana.com under tech bulletins and articles.
There was a good bit of controversy in the homebrew group over
that conversion.

There was also an article in Communications Quarterly (summer 96)
on converting the MLA2500 to use a pair of 4CX400A tetrodes.

Either of these conversions will be cheaper than a new pair of 8875s.
I haven't seen anything on conversion to use the 3CX800A.

Hi all!

I bought a Lafayette HA-50A FM Radio receiver (30MHZ to 50MHZ) recently in
a flea market.
Now I am starting to get more interested in this thing and would like to
buy a transmiter (or transceiver).
Do I need Liscence to use this band?
Wich transmiter or tranceiver would you recommend to use for this
frequency?
How far a trasnmitter in this band can go?
What type of antenna I need for this receiver?

As you probably noticed, I am new to this hobby ....

Cheers

Milton Martins

This may be a dup in some newsgroups, and i applogize.

I have an Alinco 599t, and a KAM+.

Receiving is no problem

Transmitting from cpu to tnc, no problem, the tx lights up on the tnc, but the radio doesn't key up.

I have tried to reset the tnc via pulling the battery. I need to know if anyone has the pinout for the alinco. The cord I have is a premade cord, and the dealer said it was for alinco.

Can anyone help.

Thanks, and again sorry for the duplicate in some news groups

Hi Bill,

John is correct about Forms, it works on the principle of booting off an infected floppy. It's a relatively harmless virus.

How FORMS and DOS booting works is like so..

The boot sector on a disk normally contains a very small program of some sort, which is loaded and run if the PC is trying to boot from that drive. If it's a system disk (e.g. a DOS boot floppy) the program will then look for a
specific file (in the case of MSDOS it's IO.SYS) which it will in turn load and run. IO.SYS is another program which will then continue loading the other parts of MSDOS until COMMAND.COM is loaded. COMMAND.COM is the "user interface" that gives you that friendly "A:\" prompt.

The reason it works that way is that the boot sector is too small to hold a "real" program, so a smaller bootstrap (meaning to pull oneself up ny one's laces) program is used.

If the disk is formatted but *not* a system (bootable) disk, the format process still loads a bootstrap program into the boot sector, but all it is designed to do is display that "Invalid system disk...." message on the screen.

What happens with FORMS is it loads itself into the floppy's boot sector. When you boot from an infected disk it will try to load itself on your hard disk, and when it has finished it displays on the screen "Invalid system disk in drive A:" etc, so you don't see any difference. Normally the bulk of the virus actually resides on some "stolen" sectors elsewhere on the disk, which are flagged as "bad" in the File Allocation Table so DOS won't attempt to use them.

I've seen the source code for FORMS, all it does is load itself onto disks. It does however assume an MSDOS system (i.e. loads IO.SYS etc), so if it overwrites the boot sector on a non-DOS system it could cause problems.

If you follow a few simple rules, you should be OK.

- Make a boot floppy with DOS, and a few utilities like FORMAT, FDISK, SYS, EDIT and an antivirus program if you can fit one on. If you have a CDROM, put the drivers on the disk and the relevent entries in CONFIG.SYS and AUTOEXEC.BAT.

- Get it checked out by a known clean system, use an agency if you need to. Once you're happy remove the write-protect tab (prise it out with a small screwdriver) and label it e.g. DOS 6.2 CLEAN.

After that, you should be able to boot off that floppy and examine your system. Note that some viruses (not FORMS, it's strictly a boot sector virus) can modify .EXE files, so you should keep a copy of your antivirus proggy on a clean (as above) floppy if possible.

>Is there some way I could check to see whether I have caught FORM? I
>have xtg and other ways of looking at and editing code but it means very
little to
>me except when there is something obvious I can change one byte at a
>time.

Look at sector zero on your disk, print it out. Compare with someone else's if you can, it will be different, the section of code will be a bit longer. Don't use your disk on their system though! Also if CHKDSK says you have bad sectors on your floppy (and HD) it could mean FORMS is there, but not necessarily.

As has been said, FORMS is a very prolific but very harmless virus. If you have a known clean floppy boot off it and run "FDISK C: /MBR" which will get rid of it from the boot sector if you don't have an AV program. But there are other less common viruses that infect in other ways so it's wise to take precautions.

Sorry about the lengthy post. Hope some of this helps.

73
Nick G7UFG

Oops, almost forgot. Check your CMOS BIOS settings, see if there is an antivirus option on your motherboard. That will intercept any writes to the boot sector of the hard disk. Also set the boot to C: rather than A: unless you have reasons to do otherwise.

You need to be very careful. That resistance and that voltage could turn
a helluva lot of electricity into heat - much more than 35 watts. Some
mistake surely?

Hello!

Does anyone out there have the VHF COMMUNICATIONS Magazine 2/1978 ?
There is a 2 meter amp in it made by DK1OF, I wonder if somone could make
a copy of pages 100-113?
It would be greatly appreciated.
I'll pay for all expenses envolved.

I have an old Motorola "brick" type cellphone that I really have no use for. I was thinking that the guts from this phone might be useable on 33cm.

Does anyone have any pointers to resources? I'd be interested in a tech manual or schematics for the phone, and any information on the conversion if anyone else has done it. Magazine articles, usenet posts, web pages. Anyone?

I wrote an article showing an amplifier using 2N6082 in the swedish magazine QTC about 5-8 years ago (the year after SM5AGM finished as editor). With 200mW drive you have 20W RF output, similar amplifiers are built by SM6HYG, LA8AK, LA6LCA, LA8OJ etc.

If you have the information available, take a look at
the specs for PSA's HDI engine. This is going to replace
the already excellent XUD fitted in Citro&#65533;ns. An already
excellent fuel consumption reduced by 20%. CO2 reduced
by 20%, HCs by 50% and particulates by 40%. Ozone
forming potential down 50% and produces no smoke.
The only remaining problem is NOx which is dealt with
by a cat-converter.

Good diesel fuel may well be the same price as unleaded
petrol (here) but the fuel consumption and environmental
advantages of diesels will mean that as the government
increases the tax on fuel by (20p/litre/year was it?),
the public will be forced to look more closely at this
fuel. Un-facts pushed by our ghastly media have managed
to generate an anti-diesel culture here which isn't to
be found anywhere else in the rest of Europe.

2420. Winding on old coil forms with slugs - help

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-02 00:00:00 UTC
From: Tim Hynde <hynde@flash.net>
Message-ID: <34FB131E.B9D7AD1B@flash.net>
Source record: 85389

I am re-winding some old coil forms for a receiver project. They are
1/4" forms with slugs. My question is:
If the schematic calls for a variable coil e.g. 10-18 uh should I
calculate my coil to 10uh with the slug removed or wind for something
less say 7 or 8 and allow the slug to pull it into 10-18.

Im not sure if having the slug all the way to the top completly removes
it from effecting the coil.

Thanks,

Tim, ka8ddz

HP is still making quartz oscillators and crystals. The 10544
OCXO was replaced 20 years ago with the vastly superior 10811.
The 10811 uses the doubly rotated SC cut, which was invented
here, but not by Don Hammond, rather Jack Kusters. Don does
get credit for being the founder of our quartz operation.
As you say, it is worthwhile to save OCXO's from scrapped
counters. (Incidentally, old ones are better than new ones
because they age less, in general). We have recently begun
production of the E1938A OCXO, with much better stability than
the 10811. For details, see my technical papers in the
proceedings of the 1997 IEEE Frequency Control Symposium. (Please
don't ask me to email these papers; we're not set up to do that.
However, we can snail mail hard copies to people seriously
interested). We don't sell any oscillators on an OEM basis
at this time. However, you can probably order a single unit
as a replacement part for the product it is used in.

Sorry for this, Bob but doesn't "impedance" include reactance? How much
reactance does a hot filament have? As they say 'it's just semantics'
but that's how we communicate. Right?

Hi
I am looking into the possibility of using 4x MHW720A amplifiers for
easy 70cm power amplifier.
I have 1W RF drive, and since each module needs only 20-100mW drive I
will use some resistive input pads.
The output must be combined in some way...

I will use a unitrode UM9401 PIN diode with quarterwave lines for output
switching and BA282 switching diodes for the input circuit.

any ideas how to build the power combiners as easy as possible?

Hopefully, this message isn't too far off-topic. For fun, I've been building a crystal set that receives both BC and HF (up to 15 mHz or so). Of course, there's always the problem of strong local signals popping up everywhere.

Is there any way to build a wave trap that will work in a crystal set-up? I recall reading that a wave trap of the type used with tube set-ups will not work with a crystal set. Is this true?

Any thoughts would be appreciated. Thanks!

-Dick Messick

W1DBM was Phil Rand, who died in November of 1995, the same month as another famous oldtimer, Frank Jones.

According to history, he did a lot of work in the early days of TV in combatting TVI. I've seen a number of articles by him in QST, on a wide range of topics.

Memory says that around 1977 (maybe it was '78, and even the year 1981 pops into my mind), he had an article in QST about a frequency counter. In itself, it was nothing special, using the then standard series of counters/latches/drivers for the readout, and an uimaginative divider chain. I don't think it even counted especially high in frequency. I don't have the article handy, and I can't find my file where I've put articles about frequency counters. So my recollection about what was special about this is a bit vague. But I think it had an extra latch so when you were tuned to a frequency, you'd press a button and that frequency would go into the memory. Then you could tune around the band, and then when you wanted to return to the frequency, you'd have it recorded. That does not seem like such an important feature, so either I'm forgetting something, or the special feature was something else completely.

I think, however, that particular article is fairly likely to be the basis of whatever you bought. If you open the case, you'd probably see a number of 7490's and 7475's, and if it's really using Nixie tubes, 7441's. Plus, there'd be a crystal (and oscillator, probably ttl) and a string of 7490's to get it down to the reference frequency.

What makes you think it's a vfo? Because there's a jack on the back that says "vfo"? that would most likely be for feeding a vfo from a

transceiver into the thing, so you can measure it's frequency.

If it is in fact a frequency counter, you should then be able to measure a frequency by feeding a signal into that jack.

Post again, with some details about what's on the board, including the IC's.

Michael VE2BVW

I imagine this means it will no longer have the severe Part 15 limits.

Let's see, the first thing to build will be a full-wave loop antenna. =:o

Recently acquired a used TS-940S TxRx and need to be able to use it on Navy MARS freq, which are out of the Ham bands.
Does anyone have info on modifications to make the TS-940S xmit outside the 80, 40 and 20 meter bands? I'd be glad to compensate for any expenses involved in getting them to me.

I need a micro with lots of i/o lines and interuppts etc. Have been using the PIC series but they have their limitations. I thought the Atmel devices looked good. I want the 40 pin devices, preferably PLCC package.(though I could make an adapter from a DIP socket) Does anyone know of a good (cheap!) combination of software and hardware driven from a PC?

Hello Tom,

Does the unit have 3 toggle switches, labeled "count up down", store count" and "ac on off" on the front, and four thumbwheel switches labeled "preset"? If so, it's the universal digital dial adapter described by W1DBM in November, 1977 QST. This unit permits digital frequency readout of ANY receiver or transceiver. The key to the unit is the 74192 presettable up/down counter chips. If you set the preset to 0000, and the up/down switch to up, it also behaves as a plain old frequency counter.

BTW, those are flourescent display tubes, not Nixies.

A real piece of ham history - both technologically, and from its builder.

Email me for more info.

>73, Jeff KH2PZ / KH6

This isn't commonly done except for very low currents or very short times (say, less than a second), because the energy storage capability of batteries is so much greater. For example, if you charge your 40,000 uF capacitor to 5 volts, the energy is 1/2 * C * V^2 = 0.5 joule = 0.5 watt-second. In contrast, a 500 mA-h AA NiCd cell contains about 2160 watt-seconds (0.6 W-h). A primary alkaline cell contains two to three times this much. Also, the battery voltage stays relatively constant until nearly all the energy is extracted, while the capacitor's voltage immediately begins to drop as soon as energy is taken out. So although a capacitor might be useful for very low currents (or high voltages, so more energy can be stored), a battery is nearly always a better practical choice.

Indeed, only 1350 feet on a side! A friend and I were at a hamfest
in February, and he bought a "half mile o' wire" used for military
field telephones.

It was actually two-wire line, and we hypothesized doing the "zip
cord" thing on it and making it instead a "mile o' wire..."

Which it seems we could REALLY use, given the property.

Go to your library and look up tank circuits in a copy of the ARRL
Handbook. Also study parallel LC (inductor-capacitor) circuits.
Also study serial LC circs, and how they relate to freq pass/stop.
It should take you 10 mins to make a simple one.

At that rate, you can make several and change them out.

Good luck

I was recently given a Motorola "classic" cellphone. I was thinking it might be fun to use it to build a radio to get on 33cm. I figure this will involve replacing the microprocessor with a PIC controller and tweaking the rf circuits.

Does anyone know where I can get tech manuals or schematics for this phone? And can anyone point me to sources of information on the conversion? Surely I'm not the first to think of this, and I'd rather not re-invent the wheel.

> WQ0N
>
> Yeah, yeah, I'm and EXTRA that admits he knows very little!!!

It can be done without much trouble. What you want is a simple varicap-tuned VFO at around, say 18.7 MHz, which you can mix with the 8 MHz IF to yield a nicely-standard IF frequency of 10.7 MHz. At 10.7 you can probably find some cheap, narrow (3-5 kHz) crystal filters at Alltronics or someplace similar, which will go between your IF amp and a simple diode detector. The output of the detector will drive your scope's vertical axis.

To turn all this into a crude spectrum analyzer or "panadaptor", simply take the horizontal sweep signal from your scope (typically 0 to +10 volts if you have a Tektronix scope) and use it to tune the varicap diode in your VFO.

If you can't find any narrow 10.7 MHz IF filters, then just use some 10.7 MHz IF cans salvaged from a cheap pocket radio, and do your filtering in the audio with an RC filter. It would be better to do this with a real IF filter in front of the 10.7 MHz IF strip, though, to help avoid overloading problems due to strong signals in the IF passband.

All of the above can be constructed with "boilerplate" circuitry found in any recent edition of the ARRL Handbook and similar sources. This is a lot less critical than a real receiver, and you can go the extra mile and add a log detector, etc. once you get the basic circuit working.

Ralph OM,

Is this antenna for transmitting? If not, then almost any piece of
wire works for receive-only; antenna efficiency is unimportant. But if
you want the advantage of a balanced antenna system (minimizing noise
pickup from house, computers, etc etc) then you will need a center-fed
system, or a closed loop antenna. Also, placing the antenna as far as
possible from the house helps.

Already done Jeff !! We have a bunch of old homestead sections out at the ranch that are a 1/4 mile on a side. I figure the electric fence wire will be just right and the RF should keep the cattle respectful. With the dry conditions in late summer it doesn't really matter how high you are above the dirt you are well above RF ground. Interested in more on this, this is the first I had heard of it. Previous use of the pasture fences include counterpoise to the 5/8 wave 160M vertical disaster(wind storm). You keep soldering I do WIRE !!

Howdy also to Scott he does wire too.

Have a look at the Axiom HC11 CMM-32 CPU module. The Imagecraft C
compiler is
vey nice. I heard a lot of good things about Dunfield C but have not
tried
it out myself.

For 'serious' applications, I am using the HiTech C compiler for the
HC11,
works wonders with the CMM-32. The Cosmic C-11 alsoo looks good, but the
demo is bit too cripled to my taste.

The 89C51 and HC11 are not too far away from each other, regarding
performance
and speed, but the HC11 can be programmed much easier.

Regards,
Tibor

Right, and the optimum height above average terrain for a half-wave dipole antenna for this band is 875 meters ~= 2865 feet, which is only just slightly over a half-mile high. Its length will have to be 2865 feet also, which is longer than the longest cable span ever hung. The only material strong enough to support the span is spider web, and I do not know what the velocity factor of spider web is. There will be no two-way communications on this band as there is only one place on earth that can support an antenna for it: The World Trade Center towers in New York City. The antenna will have to be a horizontal multi-loop spider web antenna, and the station will have to be a one-way beacon, since no one else can build the required antenna.

It does not.
If you can test the coil, do so BEFORE YOU UNWIND the old coppper.
test with the slug centered and ended.
Figure for the slug centered and the rest will take care of itself.
the size of the slugs and their density vary too much to get closer.
good luck

And some of them respresent fairly impressive Dx too, IE in excess of
1,000 miles with those itty bitty antennas and QRP power. They use
coherent digital signaling, of course. If this becomes an amateur band
with no restrictions on antennas, and amateur legal limit power, this
could become a band capable of very serious Dx. But I wonder how many
amateur radio operators will use the Lowfer digital techniques rather
than trying to bull through on CW. Should be amusing.

But I'm concerned about something else. The Lowfers have spent
decades developing the techniques which work in this spectrum.
Are they now to be unceromoniously shoved aside? That would
be a real pity.

Good point Gary. I played around with it about 20 years ago for awhile and found that most of the Lowfers were already hams. Hey that's why most of them stayed within the requirements for power and antenna length.....

But I would hate to see any non-ham lowfer that has been legally using that band get booted. Maybe they could make it dual use. 1 watt no license - 100 watts licensed....

2477. Design for low noise synthesizer

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-03 00:00:00 UTC
From: Brad Moersfelder <bmoers@qgraph.com>
Message-ID: <01bd46d8$e9be8760$274d31a1@bmoers>
Source record: 85418

Can a low noise 0-50 MHz synthesized source be built by mixing the output of a single loop 100-150 MHz synthesizer (100 KHz resolution) with a 100 MHz PLL both derived from the same reference? What concerns would you have with this approach? What's a better way? It seems that the tuning voltage to the 100-150 MHz oscillator would need to be very, very clean (microvolts of noise) to achieve low phase noise.

It should tune easily. If it does not, then something is amiss.

> I have the antenna connected to single ended Zep which is 63 feet long
> fed by paralle conductor feedline. Now all I get
> out of my rig is an annoying oscillation.

The end fed zip needs a 1/4 wave line as an impedance transformer.
If you are off materially from that it will present high voltage
at the tuner end (I am assuming you are using a proper tuner designed
for open wire line). If you are using an unbalanced tuner, it basically
won't work very well (the rig and tuner can't handle the rf voltages if
they are modern tuners and rigs). The antenna needs to be worked against
ground, since you are depending upon that ground to provide a reference
point against which the whole system works. On a zepplin, that was the
airship frame (the antenna was dangled upside down underneath the ship).
It will work without a ground but the voltages can be rather high on
the tuner. If you ground the center of the tuner coil or the capacitor
rotor, that will balance things nicely for parallel tuned tanks that
will work very well in most cases, and, it will tend to get rid of any
stray voltages that seem to be blowing all over your rig. This is for
parallel tuned tanks feeding the line from a low impedance line like of
some sort as opposed to the modern tuner and balun thingie. This is
for the fundamental. IF you are working multiples of the fundamental,
then you need to choose a different feedline length. They are given
in the older antenna books if you look. Memory tells me that a 45 foot
length is good on your antenna (I may be thinking of the 80M end fed
zepp). It then becomes a compromise between induced voltages allowable
and impedance transformation. Modern rigs may still not like it very
much. My OT rigs eat it up in stride and spit it out sideways for lunch.
With a good tuner, and proper line lengths, you can get a 1:1 anywhere.
and radiate much more efficiently than with a coax line. It is a little
more persnickity to tune (i.e., you have to know what configuration and
what values of coil and capacitor are going to be useful for particular
bands and whether to series or parallel tune the line). If you have
RF problems, ground the center of the tank (coil or capacitor) and feed
it at that point with a 2 or 3 turn link. I use old coax as links and
unity couple them around the antenna line tank. It works just fine,
is cheap, and has good rf insulation. If that does not work, then

you have other problems in your system that you are not accounting for. You might look for a break in your line somewhere, or a bad antenna tuner or open coax braid, or a poor ground, etc.

> Any suggestions.

All said and done, you would probably be better off with a center fed dipolish thing of some sort. Make it as long as you want, and center feed it and tune the rest in change. If you want to get picky, cut a traditional 1/2 wave at the fundamental and feed it with a half wave of line, and tune that appropriately for the band and impedance transformation desired. Make sure you have a good tuner. It can be as simple as a coil and a capcitor fed with a 2 turn link on a plank of wood (what I use most of the time), or as exotic as a good Johnson kw boxish kind of thing. One RF ammeter will suffice and can be useful for monitoring line current. It helps you to know if your SWR bridge is telling a fib or the truth. It can also be used as an antenna output indicator regardless of what the SWR is (and the SWR can be very high and still work just fine).

As a test on the fundamental of your end fed zepp antenna system (I am assuming it to be 40M), short the feeder line together and load it up as a 3/4 wave antenna. If it loads easily, then the antenna system is not at fault, but you have some other problem that needs looking into. If you still have RF problems, your ground is nil or you have a bad joint somewhere in the system so that ground is not actually obtained. If you hook your rig to it directly and the SWR is much over 2:1, then you have a high impedance ground probably. A 3/4 wave antenna should be a good match to 50ohmish rigs, without an antenna tuner. If it does not, the ground is no good or the antenna joint at the antena/line junction is no good (it will be a high impedance point there and will need to be a good connection for best operation --- the line will load up as a 1/4 wave antenna otherwise, if shorted at the transmitter end, BUT, when you open it up and connect the rig, it will be a null antenna if the joint is poor and the ground is good, and could give rise to your RF problems.

Subject: Antenna Tuner

I am trying to build an antenna tuner with a Jennings 20-300pF Vacuum
Cap and a model 850 tapped Coil... Do I need another cap?

Jeremy,

It depends on what type of tuner circuit you want to use. A "T" match, =
"Pi" circuit etc.
The ARRL Handbook and Antenna Book both have good examples of these =
various tuner circuits.
There are advantages to each type. You can use just one tuning capacitor =
and one inductor but most of the better tuners use two capacitors.

these various tuner circuits.

There are advantages to each type. You can use just =
one tuning=20
capacitor and one inductor but most of the better tuners use two=20
capacitors.

2482. Help Building Heavy Duty Dummy Load

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-03 00:00:00 UTC
From: herbr@netcom.com
Message-ID: <herbrEp9o1D.1Hw@netcom.com>
Source record: 85423

I am interested in building (or buying, if you have one) a heavy duty dummy load that is capable of handling 2.5kw of RF at HF frequencies. I have looked at the new Bird models, and the force air cool units that are rated at 3KW cost around 1200 -1300 dollars.

Is this realitively easy to build? Where would I find the resistors that can easily handle that much power, and what might I expect to spend in building one?

Is there a market out there for older Bird's that can handle it? I don't have an environment where a water cooled unit would work.

Thanks.

Herb - KG6OK

Just disable the AM feed to the final (IE: bypass the audio xfmr and
feed DC with NO audio to the final amp) and move the audio
to the VFO DC input....that will FM it enough...you will likely
have to add an audio level control for deviation!

Hi there, I was wondering if anyone can point me in the direction of a source of info on some / all of these items:
1) Frequency list for the various CB bands - In particular the one they call midband in the UK.
2) FM frequency deviation used for FM modulation
3) AM modulation depth used for AM
4) Maximum bandwidth allowable per channel legally in the UK
5) Legal harmonic surpression requirements
6) 4 Watts power out - Is this 4W MAX into a 50R +j0 load, or 4W at the antenna (erp)? (I am almost certain it is the 1st, but I want to check).

As an active LowFER, I'd like to clear up some misconceptions:

First of all, it seems that the Newsline report was the result of some kind of time warp. The ARRL hasn't filed any recent petitions with the NTIA. The most recent formal action took place in 1995. However, with the creation of LF ham bands in other countries, some kind of future action seems inevitable.

Ironically, even though no license of any kind is required, nearly all of the activity on 1750 meters is plain old CW. No-license code, as opposed to no-code license. Several 1750-meter beacons are running BPSK, but the only two-way BPSK activity I know of is on the ham bands where signals are good enough to support real-time QSOs. I think the one-way BPSK record on 1750 meters was set a couple of years ago when I copied Cliff Buttschardt's "HDO" beacon from California at my QTH in central Minnesota, a distance of about 1600 miles. Greater distances have actually been achieved with CW, for example the reception of California beacon "Z2" in Hawaii.

The low-frequency spectrum offers exciting possibilities for communication techniques that take advantage of its unique propagation characteristics. However, little is really happening there at the moment. You need to be pretty weird to spend night after night listening to static crashes, or even worse, watching garbage characters print on the monitor. Even I'm getting burned out, and I have a much higher than average tolerance for boredom. With a little more power and an infusion of some new technical talent, maybe LF would get interesting again.

Even if "high power" ham operations (maybe a few watts ERP) were permitted in the present 160-190 kHz region, it would not necessarily have an impact on Part 15 experimental operation. I can't imagine hearing more than a couple of hams on the band in the wee hours of the morning when LF DXing is at its peak. They would be hardly noticeable among the intense Ground Wave Emergency Network (GWEN), foreign broadcast and power-line carrier signals that already occupy the frequency. If the hams don't get 160-190 kHz, eventually some commercial interests will. Then you can really kiss LowFER operation goodbye.

By the way, why do people refer to 1750 meters as "VLF", which is 3 to 30 kHz? 1750 meters is simply "LF" (30 to 300 kHz).

2489. Crystal Radio Help

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-04 00:00:00 UTC
From: Brian Snyder <ussc@technologist.com>
Message-ID: <34FD8E54.4D28@technologist.com>
Source record: 85342
Cross-posted to: sci.electronics.design,sci.electronics.basics,rec.radio.amateur.homebrew,rec.antiques.radio+phono

I am hoping that someone may be able to help me with a project I have
been working on and just dont quite get. I am trying to use a
crystal
radio that requires no battery power to
receive enough signal from a matched transmitter and flip on a MOSFET or
some low voltage controlled switch.
I have been building some small crystal radio designs I have
found on
the net and they work I guess as they should. I can get a few am
broadcast signals but its not very loud because of course there is no
amplifier on a crystal radio. Using my meter, I am measuring 1.5 to 2
volts dc across the cathode of the diode and the other side of the coil
when I tune in a small Radio Shack Am transmitter. I was thinking that I
should be able to find a fet or something that I can use the small
voltage from the crystal radio to switch a higher
voltage circuit. In other words, I want to flip a switch by transmitting
an AM signal. It only needs to have about a 2 foot range for my needs.

If you can help me out, I would really appreciate it. If you dont quite
understand what Im looking for still, perhaps we can talk on the phone a
little more in detail.Please reply directly to ussc@technologist.com.

Thank You Alot,

Brian Snyder

I agree that's essential, but I don't know how practical it is. What I'd
prefer is a lifting of the Part 15 antenna limitations and allow the band
to continue as a Part 15 band. Putting high power amateur signals on
this band would be very disruptive. One watt is plenty if an antenna
with a bit more efficiency could be used in conjunction with the strong
coding already in use.

One watt is fine, but practically, I would rather see 25 watts or something like that. That should not bother anyone, and still be usable for various modes. The average bloke is only gonna run up a few hundered feet of wire, at best, and that would not constitute much station or power or interference to anything. Above 25 watts and there might be harmonic problems in the beacon or marine bands. that could be problematic. Below 10 watts and you really have to be a diehard to get anything out of the band. I would not like to see it unlicensed, but there should not be any problem opening up the band to users with a minimal licensing structure such as novice or tech. As some food for thought, perhaps divide it up into 160-175 for digital modes (morse and rtty etc.) and 175-190 for voice modulation modes. Leave it part 15 for normal unlicensed use, also, for a few years or permanently, to see how it would all shake out.

It would be interesting, though, to see such a band fly.....

If simplicity was your main criterion, a super-regenerative receiver
would probably be your best bet. However, they can radiate and cause
interference on the received frequency if you don't use an RF amplifier
for isolation.

Super-regen circuits appeared in ARRL handbooks of the 1960s - 1970s.

>Sorry for this, Bob but doesn't "impedance" include reactance? How much
>reactance does a hot filament have? As they say 'it's just semantics'
>but that's how we communicate. Right?

Yes, Keith - no problem. I usually use the term impedance as the more
general term, since it's there, but in this particular situation
resistance is all we're really concerned with. I am assuming that the
frequency is either 50, 60 or 400 Hz, and at those commercial power
line frequencies, the reactance of a filament load could surely be
ignored. The reactance of the source transformer, on the other hand,
cannot be ignored. It's about the only thing that provides any current
limitation on a short circuit. Anyway, the use of the term impedance
ranther than resistance sort of comes naturally whenever thinking
about an AC circuit. In a circuit that is tradionally DC, such as an
automotive headlamp circuit, such things as inductance, capacitance
and reactance are present but they have little significance. The
inductances and capacitances are so low as to be neglible and the term
"reactance" really has no definition outside of the AC world.

: cans. Are they practical for my application?

First, the Toko filters are very small physically. The laws of physics determine how high an unloaded Q a resonator of a particular size on a particular frequency can be, given that you are constrained to use copper or silver conductors and not superconductors. The small filters have relatively low unloaded Q, which translates to relatively high insertion loss for a given bandwidth. If the loaded Q of a resonator is half its unloaded Q, then half the power will be lost in the resonator. If you have a cascade of several such resonators, as in a typical helical resonator filter, the losses can be quite high.

So...bigger can be better. But to achieve high unloaded Q, you must pay attention to good construction and low loss surfaces: smooth bright copper is very near the best you'd be able to do. You can get helical resonator design info from a number of places. The ARRL pubs may well have something. On 440 for fixed station operation, you might consider using a coaxial resonator made from soft copper pipe: try for a couple inch ID for the outer conductor and maybe 5/8 inch OD for the inner conductor. That can give you an unloaded Q of around 4000. If you end up with a loaded Q of 400, that is, a 1MHz bandwidth, the losses will only be half a dB or so. You can _try_ this with "soup cans", and if you can find something plated with a good conductor it might work, but it's probably a lot easier to buy a piece of copper pipe with end caps, and mount a center conductor a bit shorter than 1/4 wave in it, with a large brass screw in from the cap on the "open" end to adjust frequency. Then you have to figure out where to put coupling loops and how big to make them to get the desired loaded Q...

Like Gary suggested, you might want to be very sure that it's better selectivity that you want before you go to the trouble of making a filter!

Notch filters for specific frequencies might help, too...but I'd be careful about just using stubs that look like a short on the frequency you want to notch. If that freq is close to your operating freq, the stub will reflect a significant reactance at your operating freq. Best to make a "zero" at the unwanted freq AND a "pole" at the operating freq, which isn't quite as simple as just the "zero".

Close-in phase noise is suppressed by a clean reference. Wideband phase noise outside of the loop bandwidth is minimized by using clean VCO power, low-noise loop filter circuits, and low MHz/volt for the VCO.

For 0-20V tuning voltage over 50MHz, gives 2.5MHz/V. Low noise designs may need as low as 100kHz/V (need band-switching).

2508. Backup Power UPS Mods?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-04 00:00:00 UTC
From: stevem@vax.area.com
Message-ID: <6dkmii$6jd$1@nixon.area.com>
Source record: 85361

Hi Folks,

I'm running a couple SL Waber inexpensive UPS/surge protection units in various applications, including power backup on an ATV repeater controller.

I only need the UPS to run long enough for the site backup generator to kick in, usually not more than a few seconds. The problem is, the UPS does not like either the line frequency or voltage from the generator, so it keeps running down the battery anyway.

Has anyone ever hacked into one of these UPS units to solve problems like this? The manufacturer does not seem to be much help.

Also, these things can be used as cheap inverters as well. The problem in this application is that the inverter will only start if there were an initial source of 120VAC to begin with. They will not cold start.

Any ideas?

Thanks

Steve Muther, WF6R

all
> shake out.

I've often wondered how Part 15 and Part 97 users would get along if
they actually could talk to each other. We already have shared Part15
allocations (such as 902-928MHz) but there's little amateur activity on
these bands and the Part 15 users are specialized (cordless phones and
wireless audio/video toys). 1750m looks like it could be a place where
there's common ground. Part 97 doesn't seem to allow for hams communicating
with Part 15 users.

I'd be more inclined to relax the restrictions on transmitting antennas
and continue to allow Part 15 operation

First make sure your detector diode is a germinium and not a silicon, its an
easy mistake to make the voltage drop on a silicon will be .6-.7 v and a
germinium will be .2v If your trying to trigger another ckt why not tap of
some power and add an amp stage?

Jim,
Funny you should mention it Jim, I just bought a box recently with a project in mind. Not a specific project, just any project requiring shielding. It reminds me of an old article with a project built into a band-aid box, or perhaps the famous Tuna Tin 2 transmitter from May 1976 QST or the companion Herring Aid 5 receiver from July 1976 QST.

Source record: 85428

DJ-S11 Voltage Controlled Oscillator Adjustment

After doing the jumper mod I found that my DJ-S11 would not
transmit above 151MHz. I needed it to go up to 155MHz.

I needed to shift the VCO frequency up a little. To do this
I opened the radio and with a pin I spreaded the VCO coil
a little. The VCO is that little silver shilded box with
a small hole in it that you can see a small coil through.
Carfully spread that coil with a pin and reassemble
the radio to test the TX range. It may take several trys to
get the range you want.

When I did mine, the before TX range was 136 to 151MHz and the
new TX range is 136 to 157MHz. The RX before range was 136 to
173.995MHz and the new RX range is 137 to 173.995MHz.

I take no responsibility for your ability to make this mod.
This will void your warranty.
Transmitting out of band is illegal!

John N6ZJB

This concern has already been mentioned and is currently being discussed on several email lists. Rest assured that any proposals for a Gentlemen's Bandplan will certainly include the "lowfers." I've suggested that not only should they continue to get full access to the band, but that a segment be given exclusively to them as protection against the higher-powered newcomers.

All this is still speculation. The NTIA has agreed with the ARRL's proposal, but the power companies have long fought to keep high-powered users out out of the VLF region. They'll surely lobby against this new proposal.

Helical filters exist principally because they can be made smaller than plain cavity filters. They cannot reach the same performance in terms of insertion loss for a given degree of selectivity.

The lowest loss cavity and helical filters often use silver plated chambers and helices, but you can do a lot at home without going quite this far.

> DSI of Canada makes a 440 to 450 filter that they say will do the job

I don't know of any articles off-hand, but looking in older handbooks seems the best start, you might try the old RSGB VHF/UHF handbook as well.

The definitive book on how to *DESIGN* filters rather than just bodging and trial&error is Zverev "Handbook of filter synthesis" (Wiley) the prime reference on microwave filters inc cavities is Matthei, Young & Jones.

>

Try this recipe. There's no substitute for antenna gain, so get a good beam set up aimed at the repeater. If necessary follow it with a low noise preamp, but pick a good one that was designed to handle big signals. THEN
use a filter to protect the hand-held from the increased signals. Done this way you can tolerate a lot more insertion loss from the filter and ought to be able to get some advantage from the TOKO ones.

This works because it is possible to get a pre-amp that will be much less susceptible to overload than the hand-held. Not because there are some wonderful pre-amps, but just because nearly all hand-helds are so bad ;-)

A lot of people see a hand-held as *the* basic radio when really it's a highly specialised item where just about everything has been sacrificed for size and battery life as well as toy functions.

Cheers

Hi there, I was wondering if anyone can point me in the direction of a source of info on some / all of these items:
1) Frequency list for the various CB bands - In particular the one they call midband in the UK.
2) FM frequency deviation used for FM modulation
3) AM modulation depth used for AM
4) Maximum bandwidth allowable per channel legally in the UK
5) Legal harmonic surpression requirements
6) 4 Watts power out - Is this 4W MAX into a 50R +j0 load, or 4W at the antenna (erp)? (I am almost certain it is the 1st, but I want to check).

Hoppy

Actually, 160-190 Khz. has been a "part 15" band for a long time, and it has been legal to transmit a watt into a 50 foot antenna all this time.

This is far from a useless band. It does in fact support propagation with reasonable antennas, and the "lowfers" have proven that even low power and small antennas do not prevent communications from being carried out. It is not uncommon for lowfers to talk cross-country using the legal Part 15 limits. I myself have seen communications as distant as 700 miles using one watt into a fifty foot antenna.

I, for one, would love to have the freedom to play around in this band. Experiments using digital communications, synchronous CW and RTTY, etc., down there would be a lot of fun. As would single sideband.

That would depend upon what you were trying to tune.

All you really need, to tune anything to 50 ohms (assumption no. 1 is you are using a standard 50 ohmish amateur transmitter), is a coil and a capacitor. You can get more exotic than that and add one or more additional coils or capacitors, depending upon the impedance transformation you need, and the harmonic suppression you need, and how you want to feed power into the tuner.

IF you have a low impedance antenna (end fed somethingorother that is an odd number of multiples of 1/4 wave, fed appropriately) (or a center fed somethingorother such as a dipole) put the coil and capacitor in series to form a tuner. A series tuned LC circuit presents a low impedance at the input and output and allows you to adjust the reactances accordingly.

IF you have a high impedance antenna (end fed somethingorogher that is and even number of multiples of 1/4 wave, fed apropriately) (or a center fed somethingorother such as a dipole operated on frequencies an even multiple of the fundamental, and fed appropriately) put the coil and capacitor in parallel (usually coil in the line and capacitor from the end of the coil to ground). A parallel tuned LC circuit presents a high impedance at the output if a low impedance at the input (or the reverse --- as for example tuning a 1 ohm automobile whip from a 50 ohm transmitter).

I have used this kind of tuner for years, with excellent results.
It is a sleeper of forgotton wisdom, but works as good as a fancy tuner.

You can get more exotic and put a capacitor on the input end next to the transmitter to allow fine coupling control.
But, it is usually not necessary.

You can put a second capacitor in the system to make a pi-network tuner. It can sometimes be more flexible in a tuner mounted in a box where you can't get at it with jumper clips.

You can put a second coil in the system to make a pi-L network tuner. That gives a higher degree of harmonic attenuation. I would recommend this for consideration if you are building the whole into a big box of some sort, for maximum flexibility.

Some folks favor a T tuner. I don't. It becomes a hi-pass filter
and is essentially worthless if mistuned. A capacitor and a tapped
coil is all you need for a T tuner. This is sometimes known as a
``universal transmatch''. It is very poor at harmonic suppression.

It can get more exotic than that if you need to.

But, if you are just running a typical end fed wire.....
if it is 1/4, 3/4, etc., waves long, use a series tuner,
if it is 2/4, 4/4, etc., waves long, use a parallel tuner (L network).

When you mount the glass vacuum variable, be very careful to keep
it properly aligned and not subject to torsional stress so you don't
inadvertently break a glass seal somewhere, if bumped. The use of
a flexible coupling shaft or a pair of flexible couplings and a fixed
shaft is recommended.

I use the breadboard version of tuner this and it works just fine.
25 years back, a college buddy made his out of a loose coil of
no. 10 house wire held with string to a board, and a pair of
foot square aluminum plates separated with a sheet of plastic.
The principle works fine, and you can get as simple or as complicated
as you wish from the basics.

Tune for maximum output via a FS meter (or use an SWR meter and a
FS meter) and you will do fine.

Good Luck....

HP is doing a really good job of keeping it secret if they DO sell crystals!

Any chance I could get an address and phone number for the appropriate HP office that sells crystals?

Thanks - Bry

Well, let me offer a pearl of wisdom from my mentor of a long time ago.....
N1KW. Back about 25 years or so when we were poor college buddies and
did not have the proverbial bucket to pee in, ol Bob, used a most workable
and interesting tuner for his transmitters. The coil was an air-wound
roll of no. 10 house wire (a few cents back then at the hardware store),
and the tuning capacitor was a pair of 1 foot square scrap aluminum plates
separated by a piece of plastic (glass works too). It was mounted up
on a board hung on the wall by the window with a big plastic pillbottle
as the handle on the ``rotor'' tuning plate. The darned thing was ugly
as sin, but worked all the time, without fail. Granted, you probably
want something better than that, and you will have to look around hamfests
or buy something commercially made (tends to be expensive for good bread
slicers and isolantite coils these days). But, as hams, we need to
put on the ingenious thinking caps and see what we can do with or make
ourselves. Back in the late 20's the 80M rig at the headquarters
ARRL station used homemade breadslicers with square plates. A roller
inductor is a bit more problematic to build from scratch, but a plain
coil with a sliding wiper contact (in the manner of the early spark
tuners) would do nicely..... Lessee.....

...take one threaded 1/4 inch shaft, some spacer washers, some cut and
filed aluminum plates, a couple of bushings from old potentiometer
housings, and some 3/8 plastic insulator mounts for the stator plates,
a few pieces of angle aluminum.....

Don't laugh too much..... I still use such a tuner today, and it
still works just fine......(:+}}....

enuf fun.... Good luck finding parts. DE NA4G/Bob

If you are measuring that high a detected voltage, try using a Darlington
pair for the
keying device. MPSA13, MPSA14, etc. You will need the current gain
offered by the Darlington.

The usual charge for commercial lead acid batteries is C/7 for 10 hours.

You need a voltage for charging of around twice the battery voltage.
Plus, you need a suitable charging resistance to allow the rated
charge to flow, in current limited mode.

In your case.....

C=7ah
C/7=1 ah for 10 hours.

Thus you need 1 ampere of charging current for 10 hours to fully
recharge the battery. The extra time is required for proper chemical
forming of the plates. LESS that the required amount will never fully
recharge the battery. Most of the ``dead'' batteries you see charged
from constant voltage sources are not actually dead, but are, in fact,
undercharged so they only seem dead. If your battery will discharge
at the rated current of 1 ampere into something like a 12 volt auto
headlight, then the battery is fine and not dead. If it never gets
more than about 10% or 0.1 amp out of the battery, then it probably
has a sulfated cell, and will be difficult to restore except for
possibly float charging at C/100 to C/400 for a very long time.
If it accepts charge at the slow rate and then will discharge correctly
after cycling through several charge/discharge cycles using an auto lamp
load (1 amp max --- maybe two 12 volt lamps in series or a 200w 110 v
lamp as a better load on a small battery like your 7ah size), then it
will proabably do fine, and be servicable for your use. If not, one
or more cells are open due to sulphation or dry electrolyte. These
sealed batteries can be rewatered if you are careful, but it will
require careful pipetting with a syringe or small tube dropwise with
distilled water and the a long slow recharge to bring up the high
resistance sulphated cell. That may or may not be successful.
The seal covers are difficult to remove and difficult to keep
in place, once removed unless glued back into place (making sure

to replace the rubber vent caps and not to block gas venting).

The voltage for charging is irrelevant in current limited mode, but typically is 2 to 3 times the battery voltage. I use a 32v source on 6 or 12 v batteries, with the proper series current limiting resistance determined by lamps inserted into ordinary houshold lamp sockets (breadboard type).

In the old days, 120 volt batteries were halved and charged on 120vdc ships line with either resistors in series to give the rated charging current OR plain old fashioned ordinary lamps. A typical 100 watt lamp from a 28 volt source will give around 1 ampere charging current at 12v.

IFF you choose to float charge or voltage charge your battery, consult the table marked on the side of the battery for the correct voltages (if it is there). If it is not there, then I would estimate that that particular battery would float on a 13.5 volt source to maintain full charge (that may vary slightly with battery condition and age). The actual value can be found in the manufacturers tables but is usually higher than most folks seem to use, in practice, so the battery may never fully rechage on some float chargers or regulated power sources, if the regulated voltage is set too low.

Good Luck

There was an article in 73 for February 1991 about this, entitled "Radar
Detector to Microwave Receiver Conversion" by Steve J. Noll, on page 10.

It showed how to convert a radar detector to a 10GHz receiver. It might
be a place to start.

You have to remember that this is a _REAL_ WORLD_ 2_way_ radio, not a scanner as such! If you are a working radio user, be it public safety-taxi driver-lineman-delivery driver- et al.... can you do your primary job AND monitor more than 16 separate channels at the same time? I can't! Now if my job is to LISTEN to the radio, I can do maybe 25-50 depending on what the normal traffic is per channel, but I cannot do that well with ONE radio..... there will ALWAYS be a situation that requires "locking" on one channel or more for a reason... and there is NO scan priority system that can ever be dynamic enough to deal with that...!

Sure, maybe the Kenwood can have a bigger scanlist... but see which one you will find in the majority of fire apparatii and patrol cruisers....

Wow, a newbie asks a simple question and gets dogged over it. Some are psychic, some are psycho. Most if not all of the tuners on the market use a pair of caps, so that is PROBABLY what you want to build.

Well.. first thing that comes to mind is putting a voltage regulator between the generator and the UPS. I beleive Tripp-Lite makes such a unit. As far as UPS's are concerned... I only go with Tripplite... and I think you'd have better luck getting tech support from them than many other companies... they are very nice to work with.

>some low voltage controlled switch.

I was fooling around with a similar scheme but with a wide-band (and illegal) spark transmitter. I couldn't get enough power from a germanium diode to do anything at all, and my amplifier circuit was getting grotesque. I finally decided to just use a battery-powered AM transistor radio. Tuned the radio to a blank spot on the dial and plugged an LED into the headphone jack. The LED lit up when the transmitter was keyed. An opto-isolator could be used to operate some other circuit. You'd have to have a modulated signal to do this, but since you said you were doing AM, I assume that you already have one.

AM pocket radios are _real_ sensitive.

We went paddling in the sea downstream from Windscale with 2 little dogs, a few years ago. They seem OK (The dogs. And the feet. The "Daily Mail" would be far more worried about what the poor little doggies left in the water. AND the feet.)

We also went swimming off Aldeburgh, not 2 miles from Sizewell, most mornings. Then one evening we walked back from dinner after dark and saw the sea glowing green where the waves were breaking. Very pretty but we paused for thought. After realising the true explanation we resumed bathing in it.

Re: Help cellphone - 33cm
By: gbelton@bellsouth.net (Gerald Belton)
On: Sun 01 Mar 1998 20:20:52 GMT

The September,1995 issue of 73 Amateur Radio Today featured a bit on using old "bag phones" parts on 900 MHz. The Above & Beyond column for that month was titled: "The Surplus Cellular Telephone - 900MHz Component Parts". The author described disassembling the phone and gave a brief description of its components and possible uses. He spoke of the MC145146 synthesizer chip in his unit, and mentioned that it was processor controlled and would not be suitable for dip-switch frequency control. He also speaks of the 12.45 MHz TCXO and tapping into the 10.7 MHz IF.

The author of the column then (and now) is C.L. Houghton, WB6IGP [clhough@pacbell.net] of the San Diego Microwave Group. He wrote a very informative article on the group in the April 1996 issue.

Hello and thanks for reading.

I have two Lambda 65 amp switching power supplies that I would like to parallel for 130 amp use. The supplies are typical Lambda configuration variable voltage adjustable (12v to 16v), current limiting and remote voltage sense capable. Is there anything I should know before I just hook them up in parallel?? I would greatly appreciate and comments or advice.

Thanks and 73, Sam--K8WVA--

Greetings all,

I have a vintage IC-215 (146-148 MHz Xtal controlled) FM transceiver.
I am looking to dedicate this to APRS and packet on the lower end of the
2M band. HOWEVER, ths rig was only designed to work in the 146-148 Mhz range.

Any ideas on how I can mod this down to around (gulp) 144.390 / 144.97?

Thanks

At one time the power companies did a lot of switchyard control via
carrier current signals in this spectrum. Almost all of that has moved
to fiber optic today, or soon will.

If you are involved in the design of transmission lines, directional couplers, distributed filters, or RF & microwave electronics in general, take a few minutes to acquaint yourself with TransCad(tm) Version 4, the most comprehensive single & coupled structure synthesis offering available:

http://www.webblabs.com/transcad.htm

TransCad is without peer. And with TransCad there is no single-user limitation. The one-time $1,450 license fee allows department-wide TransCad usage, with no annual support fees and free upgrades for two years! TransCad is a necessity for every department involved in the design of high frequency electronics. For more information, see our web site or e-mail your questions. TransCad is in stock for daily shipping to any destination worldwide.

Sincerely,
Kathy Goerg

AMEN, Brother !
I have had occasion to try several people, and Tripp Mfg Co outstrips
the rest by far ! ! !
And I was not an ideal person for a customer service person to deal with
either.
But they gave me what I needed, and on some of the others, I am STILL
waiting for feedback.
Sears was the second best, and called me to interrogate me about when
and where I bought the invertor, and I said I had given them the same info
I gave Tripp (Make, size, mod. No.) and already had a Tripp schematic,
and hints what probs to look for.
Sears seems not to know their own part nos.
Let's hear it for Tripp Mfg Co ! !

>will the power companies of the1750 M band?

I believe the power companies send telemetry signals over their lines
within the 160-190 kHz range. They fear that amateurs transmitting RF
at those frequencies might create problems with their equipment. (Think
of their lines as very long receiving antennas!)

I just got a large parcel with valves from abroad. After much digging,
some very nice ECC 801S Telefunken valves appeared. Absolutely unused
in original boxes and with the diamond between the legs (Eh, I mean
-pins)
The price is US$ 45.- each or highest bid.
E-mail me if you are interested.

Best regards,

Arnold Goks&#65533;yr

HAMFEST March 8, 1998 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB & SUFFOLK COUNTY RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST-COMPUTER SHOW - MARCH 8, 1998

LINDENHURST, LI - NY

On March 8, 1998 the Great South Bay Amateur Radio Club & Suffolk County Radio Club will again sponsor an indoor Hamfest-Computer Show. The location Will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.

This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and access-ories, software, books, technical manuals, ARRL information, Amateur Radio License Exams and information. Door Prizes. General admission is $ 6.00. $5.00 with coupon. (Coupons will be available at the door.)

ARRL VE - 12:00 NOON
For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam session. 1998 ARRL/VEC fee is $ 6.35, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

For vendor and additional information pleas contact, Tom Favilla N2MIG at (516)957-5985, during EVENING HOURS (7PM-10PM), or info@gsbarc.org
NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available. Tables are 2.5ft x 6ft.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is available during the club 2-meter info net:
GSBARC-Monday at 7:00 PM on the W2GSB repeater, 146.685 -600 4Z(136.5)PL.
SCRC - Wednesday at 8:00 PM on the W2DQ repeater, 145.210 -600 4Z(136.5)PL .

My Industry Canada wall chart shows 160-190 kHz allocated to
the Fixed Service in Canada.

I too have heard about IC tolerating ham use of 160-190 kHz,
on a low-profile, non-interference basis. I've never been
able to confirm it either.

Source record: 85243
Cross-posted to: alt.radio.scanner,rec.ham-radio,rec.radio.amateur.homebrew,rec.radio.scanner

Spectra radios allow several different types of scanning.First, of course, each frequency needs
to be loaded into a mode location. You then have the following options: operator or mode slaved
scanning. If you set up for operator scanning, you only get sixteen scanable frequencies. If you
set up for mode slaved scanning, EACH MODE gets a different group of 16 scannable frequencies.
Ditto for zones. The A7 and A9 seem to use the same firmware, and vary in power, features,
and control head. Unless you are doing your own programming, which requires a RadioInterfaceBox,
the Spectra.com program from motorola, etc.., using this wonderfully complex two-way as a scanner
is.....well, it's not very....appropriate. Buy a scanner.
sorry. John

2569. Tube internal Capacitance

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-06 00:00:00 UTC
From: ll2925@aol.com
Message-ID: <19980306210001.QAA27793@ladder02.news.aol.com>
Source record: 85244

Building a small single tube amp. Using 811A (809 for now during
construction).
The the output tank circuit was found in a circa 1950's handbook. The "tune"
capacitor is a 100 uuf which I have already(old johnson). The "load"
capacitor
that makes up for the internal capacitance of the tube is shown to be a
1000uuf.
I have a 500 uuf, can a capacitor of suitible value and rating be used in
conjunction if the range is suitible?
Guesss it depends on the internal capacitance>

Anybody have any expirence in single ended transformerless output amps?

Experimental operation on the 160-190 kHz band is now permitted in Canada with restrictions similar to those we have in the US. For more details on the relevant rules, check out:

http://members.aol.com/part15/whatisit.htm

and for more information on longwave in general, visit the Longwave Home Page at:

http://members.aol.com/lwcanews/index.html

By the way, the Newsline report of a recent ARRL petition to the NTIA regarding a ham band in the LF range apparently was in error. Details are available on the Longwave Home Page.

Regards,

Lyle, K0LR

It very well may be classified, but it's common knowledge in Idaho
where it happened (where I learned of it).

My details may be off somewhat, but it goes like this:

It was an experimental 3MW reactor operated by the U.S. Army. During
the Christmas shutdown a crew of 3 techs (minimal nuclear training)
were to do maintenance on the rod drive motors. The rest is
speculation as the crew was killed and no one knows for sure, but it
seems that after servicing the motors, a tech was swinging the first
one back into place on a chain fall and decided that it would be much
easier to pull the control rod up to the motor to attach it rather
than bolt the motor in place and then attach it to the rod. This
reactor was designed such that a single control rod could take it from
shutdown to supercritical (Not surprising since the design was for a
portable field reactor for Army use). The tech apparently got the rod
up about a meter when the reactor went supercritical and the cooling
water surrounding the core flashed instantly to steam thereby forcing
the other control rods from the core from the pressure and
subsequently cooking the crew. The fact that the core was not
pressurized and the water vacated immediately resulted in more of a
squib reaction than a full nuclear blast. It was a slow fission
reactor and with no water to moderate the neutrons, the reactor
basically shut itself down. The core was damaged beyond repair and the
whole plant had to be decontaminated and scrapped.

If it's that broadband it's goto to be linear.

If it's linear it must be Class A.

If it's class A it must be less than 50% efficient.

Good luck finding what you want!

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-06 00:00:00 UTC
From: Ron <rh@pcez.com>
Message-ID: <35003D4B.21AE@pcez.com>
Source record: 85254

Paul,

Yes, there are a number of 49MHz 'talkies that convert easily, and work well. Don't expect the performance of a $300 radio, but for short range, or just fun they are great.

I have converted about a dozen different types. The best working were the Uniden multichannel FM units. With an improved antenna (don't forget that many of these are not designed for a 50 Ohm antenna) I've made simplex contacts up to 20 miles. The rushboxes DO work, but many of them use only one crystal, and the tweaking to get the receiver to work on frequency is kind of a pain. My own opinion was that they were more fun back on 49MHz where they started, and just improve the antenna and coupling there. Don't try to increase the power.

Back to the FM rigs; a single transistor (class C) amplifier in the output will easilly bring them up to over a watt of output, and you can get 750mW out of them even with the 9V battery if you aren't too worried about battery life.

If you go with the Uniden units, most radio shops can get you a set of schematics for the asking.

Hope it helps,

Ron, N7TAW

Well, they don't quite go to DC, but Motorola has application notes all the way from 20 watts to KW levels for both bipolar and Fet devices. A company called CCI (Communications Concepts Inc) in Xenia Ohio, sells the PC boards for all of them and the hard to get parts too.

You can use an MRF5003 RF MOSFET if you don't mind working with a
surface mount transitor. 100 mW in will get 2 to 3 watts out. I used
two of them for my senior project and got 1.5 watts out with 2
milliwatts in. VDD was 7.5 volts but can operate higher than that. The
MRF555 or 553 is a bipolar in a macro-x package and will also do.
These devices work to 500 MHz. so care in layout is needed to keep the
devices stable.

Also the MRF5003 makes a nice receive preamp. 20 dB gain and good
noise figure. I have one working with my IC551.

Brian,
Deep within my file box I have an old page from Popular Electronics
Or was it Moder Electronics? that shows how to build a "free power"
AM reciever. Basicly it was your basic crystal radio with a
single stage of amplification. The power for the amplifyer stage
was dirrived from an additional coil on the tuner. Basicly
the tuner (the normal tuner) of an AM radio is a band pass filter
that allows a narrow band of frequencies through. (the station you
are tuned to) This radio had a wide band tap that took the out
of band energy and rectifyed and filtered it to be used to power
the amplifyer stage. Hint: we are surrounded by 60 hz magnetic
fields. I would send you a copy of my pages but I recently moved
and I don't know just where they are right now.

But I hope this helps.

Gordon

Taken from the glowbugs@piobaire.mines.uidaho.edu email list:

"... I have our book of New England Carrier Frequencies open in front of
me right now. (I'm in the substation engineering dept. of an electric
utility) We use 150, 162, 173, 173.5, 188, and 190khz as well as a few
others. The first reaction of one of our protection and control engineers
(also a ham) is that it could definitely be a problem. ..."

I just returned from John's website, and I got there by clicking
on the URL in your post, so you've got the address correct. I've
heard that AOL can limit access to sites on their system during
peak periods, although I've never had a problem personally. Guess
you should just keep trying. I just finished DL'ing his "Toroid
Proffesional" and "Ironcore novice" demos. Haven't had a chance
to try them yet, though.

73! Alan, VE3NNM

I am getting back into ham radio after a 30 year lapse. Back then you could hook up a 6V6/GT in a tritet oscillator circuit and work the world on 40 and 20 M CW with five watts!

I am looking for a "ready-made" or circuit for a similar rig using a single transistor or oscillator/PA. Any suggestions as to where such a monster can be obtained?

Do hams still use such peanut whisles?

VALVES and SURPLUS AMATEUR RADIO ITEMS from Bill Jarvis, gm8apx,
6 Peggy's Mill Rd, Edinburgh, EH4 6JY.

-PRIVATE- disposal - not a business! Please READ before enquiring!
Thanks -

VALVES/TUBES will be tested for at least 80% rated mA/V just before
packing. NOT SUITABLE FOR AUDIOPHILES OR COLLECTORS! (Condition and
history uncertain.)

Please OFFER for any ITEM or LIST OF ITEMS. Include enough for packing,
and Surface or Air Mail; also Insurance against loss or damage in
transit if you require it.

SWAPS welcome eg slide rules, advertising gadgets, charts, documents,
books (pre '60) - anything small, light interesting, to do with valve
electronics. 4 or 6 V magic eye wanted just now; also circuits of
reflex L/M Bands AM Receivers.

SORRY ! No guarantees, NO "URGENT" handling. I prefer to discuss offers
using email but phone/fax/message recorder number, during normal UK
office hours (9 to 5 Mon to Fri) is [0]131 336 4502. It's a private
dwelling so please DON'T wake us during the dark hours!

1 PL??? Looks like line O/P, slightly less anode than PL504, also has IO base (and top cap anode). -ANY INFO WELCOME.

ITEMS OTHER THAN VALVES

FET MULTIMETER for parts or repair; needs matched FETs and probably more. Was Altai top-of-range analogue but under-protected...

Early palmtop computer w/Basic: Sharp PC1500; WITH Tech Ref Manual and 2 books of inside info (machine code tricks etc) (in German). "Defaced" with engraved notes (eg ASCII values) on keyboard. Missing attachments: Cassette interface and 4-colour "pocket" printer.

1947 ROVER 14 RADIATOR CAP, Desmo, customised with slightly (!) slver-plated brass Fox Terrier for dog-and-car enthusiast. Must be unique.

RED (not repsrayed) GPO Telephone type 706F, working w. original curly red plastic handset flex, and (white) skirting-board junction box and flex.

2 DOCUMENT EMBOSSERS, obligatory for (ceased trading) Limited Companies. Dies could be changed.

2 5 inch disk filing boxes, clear smoky brown tops, with locks and keys.

78 rpm wind-up portable gramophone; black leatherette cabinet in moderate condition; plays well (1 side on 1 full wind).

EARLY BAKELITE tabletop MARCONIPHONE T84B transistor radio; some signs of life on all bands so maybe not much wrong. Released July-Aug 1960. Needs one 9V PP10. Electrically like Ferguson 626BT and HMV 1421. WITH service data. 9 pnp transistors of the OC... range. Cabinet has been "smeared" with pale blue paint!...

"889" Chinese 20 to 49.99 MHz tank transceiver (requires 24 V supply, low R loudspeaker, mic - 50 kohm seems to work FB, aerial with BNC connection. No documents, but easy to connect up and get on air.)

AVO LCR Bridge; looks well used but seems to be working correctly.

4 track 4 speed Philips Tape Recorder, lacking microphone. Seems working 100%; good cosmetically.

VERSATILE PARTS FROM 2 MICROWAVE OVENS: TRANSFORMERS (APPROX 1250 V 1 A); MAGNETRONS (condition unknown), TIMERS (condition unknown), FANS (running OK). Basis of Power Supply for "Legal Limit" final?

Looking for any particular spare part? Please ask - I have too many old, odd components to list; but I'd rather they went to somewhere they might get USED.

ZOOM LENS ex broken cine camera, Pronon zoom 1:1.8 f = 8.5 ~ 26 mm.

Around 1956 our Physics teacher made transistors by adding an extra point contact to ex-ministry microwave diodes. With these he made a MW Rx which recharged its milk-bottle-top battery from the Third Programme carrier. He also made a Top Band transmitter which led to contacts over hundreds of miles. Must have been all of 50 mW.

The IEEE version ought to be available via any library. I've just got my hands on a volume of copies of papers presented at an HP internal symposium held in Idaho in 1996, and voila! there is Rick's paper. (sometimes interesting things take surprising amounts of time to percolate around organisations).

I'm impressed with this thing. This is very clearly not the sort of circuitry that could have been arrived at intuitively. Intuitively it looks like it ought to decompose into an attempt to lift oneself by the bootstraps, and have all the putative benefits cancel out and vanish. Only by following through the derivation from an oscillator corrected by a lock-in loop surrounding a crystal-bridge notch filter, and following the network synthesis maths, can it be seen that there is a genuine net benefit. This sort of item can only be invented by someone with either an amazing amount of perseverence to fold a concept through several transformations, (or by someone with a strangely warped mind!)

Cheers
David

How about a roller inductor and half of a dual air variable on each side of
the feedline?
Then a set of toroids on the line from the rig to the tuner to assure a 50
ohm load on that side.
Would this not allow a more perfectly tuned antenna? DavidC AA1FA

Hi Andy,
The magazine article sounds VERY helpful and is badly Needed.

I have not ever seen a copy of this magazine on sale in Los Angeles. I might want to subscribe. Can you please send me by email, their email or postal address so I can inquire about cost.

Please send me a copy of the article to this address.

2604. active ant for apartment

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-06 00:00:00 UTC
From: Pushpendra S Khaira <singhpk@ix.netcom.com>
Message-ID: <35000C57.1C4B@ix.netcom.com>
Source record: 85329

hello,

I made and active antenna for aprtments using an
6 feet radio-shack whip + an standard broadband amplifier
circuit using 2n5109 from the ARRL handbook.
It seems to work pretty well, and has given me the
best reception I ever got in this damn apartment.

I seems like that putting an amplifier on the short antenna
enhance the signal to noise ratio greatly by rejecting the
noise from my computer, as this noise seems to be common mode
over the feeder.

Has anyone tried this , or other ideas for receiving antenna
ideas/experiences for apartment dwellers ?

That would probably work, and sounds rather close to Art Collins' original
Pi-net design on 600 ohm line, where twisted pair link coupling to an
input coil on the tuner was used for impedance transformation, and the
thing matched or tuned 600 ohms to 600 ohms. In that mode, it was mostly
acting as a harmonic filter. I use that mode occasionally to tune
open wire line where the rotor is grounded and the coil floats with
respect to ground, but feed it with a balanced link at the electrical
center of the coil.

If both the input and the output capacities are the same, then the usable
range of the tuner system would be less than with separate capacitors.
That split stator cap should work OK on matching to lines, where typically
the input and output impedances are similar, but would be less than optimal
on matching odd antennas directly. In the latter case you would need
finer control of the capacity, usually with separate capacitors.
You could add a series LC on the output of your coil and split stator
cap, but that would add more complexity. You could use a series C
and that would work for high inpedance feeds (without the extra coil).
There, the ratio of the the Cin and Cout on the ouput side of the coil
does the impedance transformation to the line or antenna. The split
stator capacitor is sometimes used as the coupling adjustment if it
is on the output side of the pi-net coil (a separate input capacitor
is used) and the antenna connects to the floating extra stator section.

The original query was with a single section capacitor and a single
section coil (possibly tapped or roller inductor). In that case,
he would be limited to a series LC or a parallel L network with
the minimal number of components. If he was going line to line,

there is one other interesting impedance matching method to unbalance line, typically coax lines but also single wire feeder lines, where you take the coil and capacitor and resonate them as a grounded tank circuit. Then, the input line and the output lines are tapped up the coil from ground until proper matching is effected. That is not seen too often, though, in modern amateur use.

I am curious why you would want to go to that much trouble with various torroids on the input for the impedance transformation? It would work, and could be useful to transform the line 50 ohm input to a more easily tunable 600 or somewhat ohms where the required capacity values would be less than at 50 ohms. It adds more complexity, that may or may not be needed.

Good Luck.... DE NA4G/Bob

In the US, it's been a license free band for as long as I've known about radio, and well before that. It wasn't set up to be a hobby band, but to allow some use of transmitters to those who needed it for experimentation or science fair displays, just as very low power transmitters are allowed in the AM and FM broadcast bands, and the citizen's band (though I don't know if that allowance had been completely moved to the newer 49MHz allocation). Because of the intention, and lack of license, it had restrictions o power and antenna size, restrictions that would seem to limit DX'ing because of it's low frequency.

From time to time, you'd read articles in the electronic and ham magazines about this band, and they tended to be about using the band as a hobby, not as a demonstration at a science fair. A transmitter on the band really can't be difficult, because it's so low in frequency and such low power.

But just as in the early days of ham radio (which in effect was the early days of radio), people wanted to reach further, for the simple sake of seeing how far their signals could go. They started experimenting with better receiving antennas, because while transmitting antennas were limited in size, there were no restrictions on receiving antennas. Presumably they started using better receivers, going from WWII surplus to more modern stuff. I was always under the impression that code was the predominant mode, simply because it was something that got through.

And I gather that the lowfers started applying some of the techniques used in moonbounce to extract signals from the noise. In the first issue of Communications Quarterly, there was a weak signal receiver for the lowfer band using very fancy techniques to attempt better DX. There was nothing simple about that receiver.

A few months ago, someone asked about the band, and you looked up some chart valid for Canada and dismissed the question. The band never existed in Canada, from what I have always gathered. But at the time of your question, I came across something (and I wish I could remember where I saw it) that the band may be available in Canada. Someone was saying something about it being available to hams, but I haven't been able to verify it (or even find the original reference).

So in the US, it's a no code/no test band right now. If it becomes a ham band, the no test will go away, unless there will be some sharing

arrangement where those without a license can use it with the same restrictions (or somewhat relaxed restrictions) while hams get better priviliges (if they don't, then there's no sense in making it a ham band). Whether the no code goes away depends on which license levels get to use the band.

But whatever happens, don't count on it being a DX band, with plenty of useage. It will require effort and skill to use. If you start using a wide band mode (and even SSB is wide band for a 30KHz band) you will be using up a large segment of the band. If you don't have a good antenna or equipment, you won't get out of your backyard.

By the way, this isn't the first talk of making the band a ham band. If I recall correctly, it was discussed in the talks leading up to WARC '79, though I can't remember at what point the idea was turned down.

A 300 Watt 50VDC design is readily available in Motorola application
note AN758. A kit of parts without heatsink is available through:

Daycom, PO Box 206, Oakleigh, VIC 3166 Australia
http://www.daycom.com.au

for around Aus$400. Other kits as well, inquire for latest catalogue.

The Motorola application note refered to above, as well as heaps of
other related application notes, are in

Motorolla RF Device Data Vol. II, 6th edition, 1990.
This is in the "blue" colour set. Earlier one was brown.

The two volume "blue" Motorolla RF Device Data Book 2 volume set is
also available from the above mentioned Daycom Communications Pty Ltd
for around Aus$40. This is required reading...

Hi Dana,
It seems as if we have been sharing spectrum with Part 15 users
for a long time. A 1960s ham projects book describes an 80m QRPp
transmitter for Part 15 users. With all the talk about 1750m lately
I spent some time today on the Government Docs floor of the library
perusing Title 47 Part 15 Subpart C: Intentional Radiators. Under
Under S15.223, the freqs from 1.705 to 10 MHz is a Part 15 band.
Field strength must not exceed 100 uV/m at 30m distance. Admittedly,
that's not much to work with...

People keep sending me CD ROMs with interesting things on; and I can't afford to add a CD ROM drive just at the moment. Anyone skipping such an item, please? List of mainly valves and boatanchors for swaps on request. Cash considered.

Why are They putting the latest technology into schools? Would you teach a motor mechanic starting on a Rolls Royce? Esp. if you wanted to teach the basic facts of Nature (i.e., Physics.)

And Why have Maplin, who used to be my favourite supplier, sent me their 1998 catalogue on CD ROM, along with an invitation to visit their website which doesn't make allowances for non-frames browsers?

End of long tired winge, pronounced whinge.

It already is... it's a license free band now ANYONE can use it, even you Masa, of course when you get there you'll be expected to know how to copy Coherent CW and understand how to eliminate noise before it hits your front end. It will also require something other than a wire stuck into a plastic box in order to receive anything. Keep us informed on what stations you work on 1750 Masa, should make for some very short posts.

Tim

100 uV/m at 30 meters works out to an effective isotropic radiated power of 0.3 microwatts. Now that's really QRPp! And if you read the Part 15 rules more carefully, you'll see that the 100 uV/m figure applies to broadband emissions like swept-frequency field-disturbance sensors. If the bandwidth of the emission is less than 10 per cent of the center frequency, much tighter emission limits apply. That rules out things like AM, SSB, CW or NBFM. There is an industrial, scientific and medical (ISM) allocation at 13.553 to 13.567 MHz where the permitted field strength is 10,000 uV/m at 30 meters. This is equivalent to 3 milliwatts into an isotropic (zero dB gain) antenna, or 1.8 milliwatts into a dipole. That is the only place I'm aware of in the HF range where reasonable DX might be obtained with legal unlicensed devices under the US rules. Note: 10,000 uV/m is also permitted in the frequency range from 26.96 to 27.28 MHz, but nobody seems to worry about rules in that part of the spectrum anyway :-)

Well, anywhere major construction occurs there are the occasional deaths associated with it. Years ago I saw a vintage newsreel describing construction of the Depression-era Hoover Dam in the western USA, and as I recall the primitive footage showed a "T-model" truck falling over the edge of the gigantic dam in progress. Seems like over a dozen workers were killed in that project, and that doesn't count the "gangster victims" that were mixed in with the concrete. Construction deaths also do not include the thousands of deaths over the years from mining coal. I grew up amongst Uranium mines and mills and tailings piles and I recall 2 or 3 deaths associated with accidents from heavy equipment operation etc., cave-ins and such, but I recall no old-timers dying from coughing up their lungs slowly, as they do in the areas surrounding the coal mines of the USA.
Even Chernobyl, that hiss-and-byword of the nuclear horror group, fails to approach the casualties incurred from more conventional methods of generating power. (Generalization gleaned from Reader's Digest article on Chernobyl from some unknown months ago)
Is any of this on-topic for this group? Oh Well

From: "K.R.Burtchaell" <kburt@jps.net>
Message-ID: <350191D4.559F@jps.net>
Source record: 85266

I have some 10mil 5880 Duroidsingle layer copper bonded to 1/4 in alum plate for the ground plane.I'm interested in ideas on how to use this for microwave amps.The problem I see is how to properly bond bypass caps and GaAs source leads to the aluminum ground plane.I can prepare a ground pad by etching away the top layer of copper with something like ferric chloride and then etch away the dielectric with hydrofluoric acid leaving the alum ground plane exposed.Is it appropiate to use a good coductive epoxy to bond the part to the ground plane or what?Keep in mind this is a home workshop environment.
Looking forward to some good ideas... 73 Ken W6GHV

>Jeff KH2PZ

But how much of that is still in use? I know that GA Power has discontinued all of their microwave and carrier current systems and converted to fiber optics. They pull a strand along with their high lines now. From what their engineers told me, that's becoming standard industry practice. It takes a while to get all of the older stuff out of the system, of course, but they completed the changeover 3 years ago. They still have carrier current licenses, and fixed microwave licenses, but it is now a moot point. I found out about this when I bought up all their old microwave equipment a couple of years ago. (Some nice stuff from our point of view for high speed FSK data, but just scrap to the power company.)

I'd expect that the same sort of thing is happening with other utilities based on the GA Power engineers' comments that fiber is becoming the industry standard, just as it has with the phone companies. It should only be a matter of a relatively short time until all of the RF stuff is gone nationwide.

>predominant mode, simply because it was something that got through.

What it gets through is the Q of the transmitting antenna. With such short
antennas, this is the major consideration. Voice transmission is very
challenging on this band because the antenna becomes a very reactive
load over the span of voice frequencies. But CW and NB digital do just fine.

>And I gather that the lowfers started applying some of the techniques used
>in moonbounce to extract signals from the noise.

Actually, the Lowfers were using these techniques *before* moonbouncers
tried them. And most EME stations still don't incorporate these techniques
because (according to postings on moonnet) they are non-traditional in that
they don't use by ear reception. The Lowfers have been real pioneers with this
technology. NASA has been virtually the only other organization making use of
these techniques, for their deep space probes, and that's a rather different
noise environment, so the techniques are slightly different.

>In the first issue of
>Communications Quarterly, there was a weak signal receiver for the lowfer
>band using very fancy techniques to attempt better DX. There was nothing
>simple about that receiver.

Actually, it is quite a simple receiver. It is a TRF design with a switched
capacitor filter operating at the carrier frequency. The package count is
relatively high because clock recovery was done in SSI, but that's easily
solved. Most of the receiver can be reduced to a couple of subsystem ICs
today. The frequencies involved are low enough that some of today's DSP
chips could be used there directly. And that opens up all sorts of signal
processing possibilities.

2628. Question About Transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-07 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bd4a01$da13df00$598a92d0@davidc.bit-net.com>
Source record: 85269

I saw this ad and wondered about a non-design application (I am a Ham after all!).

If the transformer will handle 5000w at 220v in and 110v out (that sounds like about 50 amps at 110v to me), would it be reasonable to assume it would handle 110v in and 55v out at 50 amps or more?

If so, would this not make a nice transformer for a 48-50v power supply for a solid state amp?

NEW!!!
220 - 110 VAC STEP DOWN TRANSFORMERS WITH 3 PRONG OUTLETS AND CORDS
Ideal for appliances and items requiring grounded connections to power line. Available in 11 wattages:

Caveat: many 220-110V (and vice versa) are wound as auto
transformers. By doing this, only half the iron is required for a
given VA rating. Downside is that there is no isolation between
primary and secondary. This means that your output voltage can't be
referenced to ground (even after rectification and filtering).

If it is an isolating type transformer (unlikely at 5KVA level) then
you will still need to derate it, as the windings won't take much more
than rated current, even at half voltage. Copper losses are stricctly
a function of current, while iron losses will scale with VA.

That's bending the rules a tiny bit. You're allowed one watt
input into the final stage of the transmitter, not one watt
output. And, antenna + feedline + ground lead must not exceed
15 meters (~49 feet). One method which overcomes having to in-
clude the feedline length in the above inequality, is to place
the xmtr itself at the base of the antenna, thus avoiding a
feedline completely.

Just obtain and plug-in the appropriate crystals for 144.39/144.97,
trim and go! It should be as easy as that!! In Europe the IC-215 was
crystalled in the 144-146 range, the 2m allocation here. You shouldn't
have any problems.

tnx. so this is the reason for step-down transformers being so small, I thought they were underrated.....

and using only centertapped primary on a 250VA transformer one can use it for 500VA as 230 to 117V step down transformer, or is possibly the cu wire too thin???

Removing the antenna length restriction would certainly help. Doubling the antenna size would allow almost a 10 dB improvement in radiated power. However, it's a lot more practical for the average experimenter to increase the power from one watt to ten watts than to put up a 100-foot vertical.

>

There isn't a lot of information available on-line as to the locations of GWEN stations. They can't be much of a secret because the antennas are hard to hide, but I don't know where all of them are. Suffice it to say that the GWEN network is rarely silent for more than a minute or two at a time, and here in central Minnesota they blow my headphones off when they transmit (if I'm listening anywhere between 160 and 175 kHz).
>From what I've heard, the GWEN network will soon be decommissioned and some of the antennas will be used for differential GPS beacons, probably operating in the 300-kHz range.

> > foreign broadcast
>
> How active and from where is this coming?
>

The strongest one is usually Iceland on 189 kHz. Often very strong in Minnesota until a couple of hours before local sunrise. It has to be overwhelming in the northeastern part of the US. There are others, mostly European, at the standard 9-kHz spacings, and one at 187 kHz, but I seldom copy their modulation. If I open up the bandwidth even to 2 kHz

there is so much junk coming in that it takes one heck of an AM signal
to be readable.

> > and power-line carrier signals that already occupy the
> > frequency.
>
> I thought these were rapidly phasing out? Are they still very pervasive,
> or only in certain geographical regions?
>

Here again it's hard to find any data on how and where the power
companies are using low-frequency power-line carriers (PLCs). I haven't
noticed any reduction in the number of PLCs at my location over the past
several years. Like most LowFERs, I tend to refer to any unidentified
carrier as a "PLC". That's probably what they are, but there is no way
of knowing. I doubt that the electric utilities are making wide use of
PLC for control purposes. It is unusual in this area to hear a signal
that is keyed or carries any other evidence of modulation. For the most
part, they are just steady carriers, which I assume are "supervisory"
signals to verify continuity in long transmission lines. If that is
true, it is an application where PLC may remain the most effective
technique for a long time to come.

> > If the hams don't get 160-190 kHz, eventually some commercial
> > interests will. Then you can really kiss LowFER operation goodbye.
>
> Who might want it?
>

Longwave broadcasting? Not likely in the US, but who knows for sure? The
extended ground-wave coverage would make it more attractive than the
1600-1705 kHz extended AM band. Possibly differential GPS, if the
existing channels around 300 kHz get too crowded. Nature abhors a
vacuum, and that seems to be especially true in the RF spectrum.

A got a lot of this very nice valve. Unused in original boxes and many
sealed as well. This valve is close to the 6AL5, but it is a special
selected version.
How about a balanced modulator for your SSB rig with Telefunken
valves?

I have also many EF 800 and EF 805S Telefunken. All new and in
original boxes. Great valves for radios!
E-mail me if you are interested.

Yes, but under modern conditions, you really want frequency agility.
Also, I'd be looking for 3 or 4 transistors rather than 1 or 2. The
keying quality is better and you can use a wide-swing VXO to get as much
as 15 kHz shift on 40m.

My home page (URL below) contains more info.

Hi Mike and All

If you are just looking for signals and are not too interested in their details, you could try a direct conversion receiver.

Take a NE602 type mixer and sweep its oscillator around your 8 Mhz IF using a varicap controlled by a saw-tooth voltage. Feed the output of the mixer into a low pass filter (1 KHz ?) and then into the Y axis of a scope. Feed the voltage used to sweep the oscillator varicap into the X axis and you will have a pan adaptor.

Each signal will show up at two places with this technique. But with a low pass filter of 1 KHz it would not be further than 2 KHz away, not too bad. The low pass filter can be reduced giving even better effective bandwidth. Anyway, the scope trace would not distguish between signals in the effective bandwidth anyway.

The data sheet shows the NE602 output as DC coupled so it might be fairly flat over the effective bandwidth with minimal strange stuff happening as the input frequency matches the oscillator frequency.

Hope this is of some help.

There isn't a "tune mode" adjustment. When in tune mode the screen
voltage on the finals is halved by a voltage divider in the power
supply. What has happened is the divider is open. I am at home and don't
have the designators but look at the schematic for 2 56k resisstors in
the power supply board. If you can't find them then e-mail me tomorrow
and I will look them up.

There are plans in the the HB for a tranceiver, if you do a web search for
'lowfer' you'll find lots of converters and the like.
The hardest trick down there is cancelling the noise.

U got it!!!
Linux _is_ to Windows what Betamax was to VHS!

Why do you think the majority of images you see on your televsion are
gathered using
GASP .....betacam! Beta was a far superior product to VHS and always
will be.
Marketing and release of the licensing of the format was the secret to
VHS success, not
quality.Marketing is also the reason for success of Windows...._nobody_
would accept
the horseshit brought to you by Microsoft if they were _really_ thinking
and not mindlessly
accepting marketing vs real world scenarios.

Windows is to crashing as VHS is to being "un-broadcastable". They are
both a given.

They say you can't polish a turd. Never tried. But Bill G. is as close
as close can get.

Newsline Story Triggers Flap in LF Community. An apparently outdated story
distributed by Newsline, and posted early last week on the lowfer@qth.net e-mail
reflector, generated an extraordinary volume of response.

According to the story, as posted on the mail list, "The American Radio Relay League has successfully
petitioned the National Telecommunications and Information Administration in hope of gaining that
agency's support for a new ham band at 160 to 190 kilohertz." This naturally raised the eyebrows of many
readers.

However, the story didn't add up. For one thing, one doesn't petition the NTIA in matters of this kind. For
another, it had the ring of old news, since NTIA had made the suggestion on their own, over two years
ago, as reported at the time in The LOWDOWN.

Your Web editor spent a day online, trying to find any indication of new action by the NTIA or ARRL.
Meanwhile, Lyle Koehler went right to the source--his ARRL Division Director, Tod Olson, who is a
fellow LowFER. As it turned out, the Newsline story had already been brought to the attention of ARRL
headquarters by the New England Division Director, and David Sumner had sent this reply to all board
members:

"We have made no petition to NTIA. What we did, several years ago, was to identify the LF requirement in the course of an NTIA study, the results of which were reported in QST in June, 1995. Newsline may be in a time warp on this subject."

Try Ramsey Electronics:
http://www.ramseyelectronics.com
They sell a tunable 2 meter receiver kit that is actually fairly stable, though for real "hands-off" long term monitoring you'd want a crystal controlled receiver.
You might try rec.radio.swap asking for a surplus commercial pager too, though none I know of offer PL-controlled squelch, most have either or both open carrier reception or some sort of muted monitoring using codes (such as 2-tone sequential) to open the speaker.

I would highly recommend that you consider a crystal controlled unit that
you dont mind ripping into for beacon operation rather than consider a new
radio for beacon service.
An even better radio for beacon use is to find an old cb/car alarm that
sends out tones to a pager. These units have no receivers in them and have
a limited number of parts to remove to make them into beacons. They can
be had at hamfest and
flea markets for only a couple of dollars at the most since they cannot be
used at cb's
and run 4 watts on 11 meters. Best of all they are so simple that you
really dont need a schematic to figure them out!
I aquired one of these units for my beacon. I removed the audio amp.
The modulation transformer was also removed and replaced with my keying
transistor so it only keys the driver and final. I separated the b+ out so
that the osc circuit runs continously.
I only had one crystal to deal with and so there were no switches or
contacts to mess with and added a small variable cap to my crystal so that
I could compensate for aging of the crystal. Tuneup to 28.215 Mhz from
27.195 was too easy.
I also added variable supplys so that I can control my power output. I run
1 watt so
I reduced B+ voltage down but would have no qualms running it up to 5 watts
(my unit will get to 7 watts @ 14.5vdc).
My beacon has been on the air continous with this transmitter since July 96
on 28.215 Mhz from Champaign, IL with no problems encounted. Before that I
used a home brew transmitter that used a 7400 IC and two 2N3904's as finals
that ran 250milli watts but that is another story.

How did the old-timers get Xtals at the freq they wanted? Is it still possible for the average goober to get some quarts custom cut without having to pay over $100 or resorting to frequency dividing?

Tightwads want to know.....

A lot of the proposed sites are listed in the book "Nuclear Battlefields,
Global Links in the Arms Race" by Arkin and Fieldhouse. Some of the
listed sites may not have ever been built, as they tended to have a very
high NIMBY factor with their neighbors.

There's a map on page 32 of the book that shows 7 or 8 relay nodes in
the Dakotas, around the missile fields, no wonder they're loud there.

>Jeff KH2PZ / KH6

Nearly everyone does locate the transmitter (or at least its
output stage) at the feedpoint. And nearly everyone uses a
ground mounted vertical, so the ground lead length is nearly
nil (though the radial mat certainly isn't, at 100x100 mat is
desirable to get ground resistance down under 1 ohm). Switch
mode PAs can easily exceed 90% efficiency, so nearly a full
watt of output is possible too. Coupling it into the extremely
high Q low radiation resistance antenna is where the challenge
comes into the picture. (The antenna is often used as the final
tank circuit.) Getting a radiation efficiency from the antenna
exceeding 0.1% is quite a challenge. A station would have to
be very well engineered to get more than1 mW of radiated power.
Most are probably radiating only a few tens of microwatts. This
is *real* QRP operating.

I live in New Hampshire and hear some AM modulation in the LowFER band but cannot make out any of the words. At first I thought these were harmonics from a nearby AM broadcast station on 1370kHz. Their trasmitting site is perhaps 1 mile away.

The signal at 189kHz isn't overwelming here but some other signals can be at times. I can hear some of the other European broadcast stations such as the one at 187kHz because its in either Portugese or Spanish. I can most definately hear GWEN signals. They can be overwelming at times, however there is a GWEN site located only 200+ miles away in the Hudson Valley region of New York.

I'm using an Alinco DX-70T which I modified to extend recieve coverage down to 30kHz so the receiver is not that sensitive below 500kHz and a quarter wave sloper with extensive ground radial system for 160m.

I haven't heard any LowFER beacons yet with this rig. I generally listen from after sunset to 23:30 eastern time.

A bit further up the band, I can copy many of the NDB's in Eastern Canada, Southern Quebec and Northeastern U.S.

I have a Kenwood TS-820S with EXTREMELY low
output in the TUN mode. Everything else is working at
specs. I get full out put in CW and SSB.

How do I adjust the TUN mode?

Where is the adjustment?

I can't find a service manual, it is out of print and Kenwood
apparently either doesn't have one, or is not willing to copy
the one thay have as they used to offer.

I need to use this TUN mode to initially tune my amplifier
so that I don't blow something up or scortch it.

If a beacon is all you want then try one of Radio Shack's (or any other brand for that matter) 1 to 3 channel walkie talkies and just re-crystal and re-tune them for the 10 meter portion you want. You can get creative and gut it out of it's own case for a project box of your choice big enough for a homebrew amp!

Good Luck

Hello All,

I have been thinking about a 6 meter cw xmiter/xceiver something along that lines just to play around with or use as a beacon.
I was just wonder if a simple unit like the Oner, Pixie-2, Smite, ect would work on 6/2 meter? I mean what makes VHF so much harder to build for than hf?
Anyone have plans for a simple 6/2 meter Transmiter or Transceiver, Rock bound would be just fine since I'm going for simple, and less than a watt output is good.

Thanks.
Jim,
KC4SMH

David,
Perhaps you don't understand how the GEET works. It is not using electrolysis
to split the water and use it. You simply run it in the tank like gasoline.
Even if the mileage would go down, (it should actually increase) it would
still be acceptable as water is still essentially free.

I've used a pair of 40 meter Hustler mobile whips in a dipole
configuration with success running 5 watts with an ARK4 transceiver.
Don't give up on 40 meters if that's the band you really want to work.
I made my own threaded poles to replace the Hustler unit so that I can
break the whole thing down into about a 2 foot package.

Hi again Bob,

I forgot, on manuals: try HI Manuals. They are advertised in CQ and
QST I think. Never have been impressed with Kenwood's factory
support organization, from high prices and horror stories I have heard
over the years. Fortunately, the TS820 is not only rugged, it is
REPAIRABLE.

Don, W6JL

2681. Mixing DSB with VFO question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-09 00:00:00 UTC
From: Tim Hynde <hynde@flash.net>
Message-ID: <3504999B.34B7766F@flash.net>
Source record: 85151

I really like the 'clean' sound of a DC RX I've built, I have a DSB generator that I would like to add and make it an SSB tranciever, I was going to just run DSB but think I'll probably add an amp so I want to eliminate the upper side band.

Take the vfo into the dsb generator and mix it with lets say 2.500MHz xtal the output through a 2.502MHz XTAL or whatever is appropriate to filter out the upper or lower sideband into another mixer with an input of a LO of 2.500MHz and the VFO.

Should this not give me an SSB signal on my VFO freq ready to be amplified? I may have the freqs wrong but is the concept valid. How else might I do this? Im going to run at least 30 watts and did not want to have both sidebands.

John I packed my NorCal 40a all over the place, in the mobile I used a 'hamstick' equivalent (loaded fiberglass whip and stinger) I filled a page in the logbook on my way from Detroit to Chicago. That was the BEST man... I also ran it at the Sunnyvale Hilton where there is a small pond in back of the hotel. The manager kindly let me string up a 40m dipole between two palms over the pond (great reflector) I used a spool of #24 enamel wire I picked up at the hamfest that morning in Pleasanton and two empty ball point pen cartridges as insulators, 35 ft of RG58 laying in the water and straight up to the feed point 15 ft above the water. That and a 4ah gel cell kept me entertained for hours during a week of sales meetings in CA.

That dipole reeled up and would fit easily into a small zip lock bag. I'd pack along a measuring tape, wire cutters, and maybe a gas torch (small) , a reel of coax with a connector at the end, and a spool of magnet wire #22 or 24. With that, you should be prepared for anything that may come your way. Some strips of plastic from a coffee can lid make for lightweight insulators that you can bend or fold over for more strength. I never checked the swir, just cut and operate.

Have fun in the Andes, "Dame dos cuy barbacoa y una soda por favor" Thats two barbecued guinea pigs and a pop please...

Tim

Jim the next hamfest you hit, pick up a copy of the OLD VHF handbook, it sold for about $4 back around 78/79 it has some really great shematics of just what your looking for. VHF just requires a little more care than HF, component spacing, pc board capacitance etc start to come into play. I built the 6m strip, about 1 watt on simplex, worked great from the git go

As I said, we are *making* oscillator and crystals (for internal
use) but don't officially *sell* them separately. If you want a
crystal, you would have to cannibalize an oscillator, as
oscillators are the lowest level replacement part. Since we've
made over 100,000 10811's, there should be plenty of used ones
around. But then why would you want just a crystal anyway?

Hi Bob OM,
Probably just an open resistor in the screen voltage divider,
which sets the power level for tune. There is no adjustment.
I never use tune mode on my TS820. Just tune it up per normal,
nothing will blow up. Trust me, I been using mine for 18 years
now (still original 6146's; they can last a lifetime with care)!
You can also use the FSK position,and tune it up for about 110
mA plate current, about 40 watts out. The rig has auto power reduction
for FSK operation. It is an excellent rig for all modes, including
AMTOR/PACTOR/RTTY. I would not part with mine.
Vacuum tube finals are not persnickety like solid state ones,
(damned hard to short the 'collector' to 'emitter of a 6146). The
pi network output allows vastly greater tolerance of (and matching
capability to) high SWR loads than the auto-shutdown SS final amps.
Enjoy!

Actually, no mention is made in the US regs as to intent or purpose (lucky for us that many government regs are written in the "Thou Shall Not Do.." sense, rather in in the much more restrictive "Thou May Only Do..." sense - what ever is not prohibited, is permitted).

>From time to time, you'd read articles in the electronic and ham magazines
>about this band, and they tended to be about using the band as a hobby,
>not as a demonstration at a science fair.

Again, you will not find anything prohibiting hobby-type operating. US Part 15 "users" include hobbyists, garage door openers, computers, hospital heart monitors, tunnel broadcast band radiators (so you can listen to your favorite station while you drive through a tunnel), wireless mics, CB walkie-talkies, et cetera.

> (unknown mf'r) LFB8, LFB15 (455KHz IF filter)

The LF-B8 and LF-B15 were/are made by NTK Technical Ceramics. They are 455kHz centre frequency, 4 pole filters with the following specs:
LF-B8: -6dB BW (min) +/-4kHz, -40dB BW (max) +/-9.5kHz,
Attn 455+/-100 (min) 27dB, Insertion Loss (max) 7dB
Input/Output Z - 2,000 ohms
LF-B15: -6dB BW (min) +/-7.5kHz, -40dB BW (max) +/-15kHz,
Attn 455+/-100 (min) 27dB, Insertion Loss (max) 6dB
Input/Output Z - 2,000 ohms
The input pin is the one in the corner. The ground pin is the nearer of the other two. The output pin is opposite the ground pin.
In the UK, Cirkit used to carry some NTKK filters, and show some very near Murata equivalents (CFU series) in their current catalogue.

Hope this helps

I own a Radio Shack HTX-212 2-meter mobile radio. I accidentally activated the Channel 1 Alarm feature (the little bell symbol is displayed and the radio beeps every four seconds).

Pages 16 and 30 of the user manual mention the feature, but don't clearly tell you how to deselect it. Does anybody know how to turn this feature off?

Why do you think they have a tune mode? Very stupid question why is the
output EXTREMELY LOW. You don't operate it in the tune mode. You tune it.

If you want to use forty year old crystals that have become inactive
8-)

> having to pay over $100 or resorting to frequency dividing?

Not these days. In those days most crystals came in an FT-243 holder.
This was a mechanical package with a few screws that held the crystal in
place, under spring pressure. The springs made the electrical contact.
Modern crystals plate the contacts directly on the crystal surface that
you'd need to grind, and they come in a solder sealed can.

Go for the AVR AT90S8515. It comes in DIP-40 and PLCC-44 (almost pin compatible to 8051).

You can program it serially (in-circuit) with a $50 programmer (Equinox MicroISP) available at ATMEL distributors.

The AVR does 1 inst per clock cycle, and is available up to 16 MHz now (-> 16MIPS). It has FlashROM for up to 4096 instruction words, 512 bytes SRAM, and 512 bytes Data EEPROM, a serial port, analog comparator, power-on-reset, watchdog, and so on.

It's a very nice chip with a lot more stuff on-board compared to 87C52/89C52 for example.

The development tools are free (atmel web page), so you go for $50 (programmer) + $12 (chip) + $1 (download time).

2700. Kenwood TMV7 TXRX <-> LCD serial protocol

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-09 00:00:00 UTC
From: marc@aargh.mayn.de
Message-ID: <PSVZB*Mqh@aargh.mayn.de>
Source record: 85226
Cross-posted to: sci.electronics.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.misc

Since quite some time I'm trying to remote-control a Kenwood TMV7 radio transceiver.

Unfortunately the mike buttons can't access all of the TMV7 functions. Even worse, the default state (eg after a hard reset) is "no DTMF mike" - so I can't turn on mike buttons from the mike. That's it about the mike, I can't use it for the project.

However, the display ("LCD assy") is connected via a 4 wire cable. The pinout is

1-PSI (serial LCD -> TXRX)
2-PSO (serial TXRX -> LCD)
3-PE (gnd)
4-PB (+13.8v)

So it should be possible to (fully) control the transceiver via this connector.

According to the service manual, the communication is async 3125 bps.

However, the bit timing is 58us (measured with osci), resulting in a rate of 17240bps. If the manual meant BYTE per second, each byte must have 5.5 bits :(Doesn't look too familiar.

I built a receiver circuit, which turns 17240bps raw data (without stop bits) into 57600bps 8N1 for reception on a PC.

I can clearly see the activity when pressing buttons, but there's a lot of traffic. I can't figure out how the buttons are encoded.

Pressing buttons that affect the display output produce far more data than others (although I'm looking at LCD -> TXRX direction). Obviously there's some acknowledgement or repetition of received data.

I never get the same two datasets when pressing the same button twice.

Twice a second, the TXRX sends an "E0" (I interpret data as LSB first, 8 bit into one byte, sync to the first bit of a block, and a block lasts until there's 80 bits of inactivity). The LCD answers with "E8". This checks wether the LCD is still connected.

Here's what I receive when turning the volume knob (dig poti, no display activity):

E8 (LCD still there)

I see a lot of F's, indicating I might oversample the signal. However there are sequences of only one same bit (as in a7), and the shortest interval I measured is what I used as bit time.

The signal looks very fuzzy on the scope, and I can't imagine it can keep sync for that long. It even looks like it is doomed to loose sync after 2 or 3 bits. And there's no regular frame structure like in 8N1 transmissions such as RS232. (I don't think Kenwood uses a PLL to recover bit timing for a 0 to 7 meter digital 0V/5V transmission) :-)

This is my problem, can you help me?

Maybe Kenwood uses this or similar protocols in other products (eg car stereo with display)? Have you seen any Kenwood protocol before?

Every small hint might help.

Are Kenwood service manuals trustworthy? Ie can I rely on the comment about 3125bps and assume there must be some kind of modulation? (Maybe Kenwood does not send a bit as high/low, but as levelchange/nolevelchange? Or even a more complex modulation?)

What experience do you have with Kenwood service manuals?

2701. Re: Antenna Tuner Parts

Fred,

While doing some research on QSK modifications to amplifiers recently, I ran across exactly the information you seek. Check out Rich Measures' (AG6K) home page at http://www.vcnet.com/measures/ and go to the bottom and click on the link that talks about balanced antenna tuners.

In addition to providing sources for caps and roller inductors (complete with phone numbers), he also has a nice article on tuners.

Good luck and 73,

Gary W2CS
Apex, NC

Hi

The NORCAL group has a design contest where they are requesting entries limited to the use of 2N2222's, no IC's, no commercial mixers,and the more common types of resistors, caps, and diodes - sort of a dooms-day type design where only the most commonly available parts are available.

They limit you to a maximum of 22 transistors. I thought this was an interesting challenge and will be submitting my entry as soon as I can bear to give it up and mail it to them. I have been having a lot of fun running about 0.25W output into a sloping dipole on 40M and working out to ~2000 miles.

This unit has features like:

12 Volt supply
One switch (DPDT) for CW/DSB selection
VOX-like operation on CW/DSB
RIT (CW only)
No relays
Diode switching Tx/Rx
Adjustable carrier level
Adjustable sensitivity
inductor-free 2-pole LPF embedded in 3-transistor hi-gain Audio amp
Chirp-free CW
Stable 2-transistor VFO for entire 40M band

Obviously, one could use some of the great IC's available today and build something a bit more sophisticated, but the idea of building a tranceiver using only the most common of devices that might be located in some backwater location seemed like an interesting challenge - so I bit - and the results have been most satisfying!

Get your soldering iron out and have some fun building something!

us>project I have been working on and just dont quite get. I am
us>trying to use a crystal radio that requires no battery power to
us>receive enough signal from a matched transmitter and flip on a
us>MOSFET or some low voltage controlled switch.

At that range, even with a transmitter of just a few watts, you should easily be able to operate a small mechanical relay, let alone a MOSFET.

BUT it sounds as though you are not yet incorporating a tuned (resonant) circuit which would give you 10 or more times the signal before your "crystal".

The usual minimal tuned circuit is a coil in parallel with a variable capacitor; let me call this LC (because L is usual for a coil and C for a capacitor).

The size of the coil L depends very strongly on the frequency (or wavelength) of the transmitter.

Tell me what the frequency is and I can tell you good approximations for L and C from which to start; or find that info in any book on amateur radio construction.

Place LC (the parallel combination) in series with the crystal, and the coil of your mechanical relay. Or substitute terminals G and S for the relay.

(You could even try connecting LC direct to G and S; the mosfet can do its own rectifying and is likely to have a diode built in to protect it!)

With the transmitter keyed on, adjust the variable C until the relay or MOSFET switches on.

At 2 feet, it is even likely that you could burn out the MOSFET, so start at a much bigger distancethan you require, and if slowly tuning C does not trigger the MOSFET, halve your distance. Repeat halving the distance until it works. Don't come much nearer or you'll need a new

MOSFET.

IF using a mechanical relay, remember that if you switch OFF, suddenly, there will be a BIG "back emf" which could blow the series diode. Put a second diode in parallel across the coil, facing the other way, to "absorb" this.

Am I right? Have you been trying without such a "tuned circuit"?

Good luck.

A good vertical for 10 metres is a half wave vertical that needs no
radials. I had excellent results with a shortened CB antenna and they
are cheap! I worked ZL from G on 18Mhz with it on my TS440 using the
internal ATU, so it is good for other bands also.
Good luck on 10.

My own experience is that 40m is easier than 20m for contacts during the day. Sure, DX is easier on 20m, but there can be times on 20m where to make any contact with QRP is hard. Of course 40m at night is not particularly good, though DX is possible if you're lucky.

An antenna for 40m need not take up much space. I would suggest 20m of thin wire on 40m. Wind it on a fishing reel. Because it is half wave, you do not need an effective ground for it to work - just 1m of wire will do. Of course you will need an ATU, but a simple L-match will do.

No. You'd be better off building a dedicated VHF Tx.

The reason why they are more complicated than HF rigs is that the average gain per stage is lower than on HF. Thus you would need 3-4 transistors to get 1 watt on 6m and probably 5-6 transistors for 1w on 2m. Also there are likely to be multiplier stages and the need for sharp tuned circuits between stages to reduce spurii.

However 6m is quite easy. If you use a 3rd overtone xtal osc, you will need no multipliers. I worked Japan with 500mW from such a transmitter in 1992. However overtone mode xtal oscillators can't be made to shift in a VXO circuit like a fundamental crystal oscillator can. So if you want freq agility, you need a lower freq VXO and multipliers (eg 17 Mhz xtal and tripler for 6m, 16 Mhz xtal and two triplers for 2m).

Solid State Design contains constructional info on these types of rigs - both CW and DSB.

When you speak of backpacking and QRP, why not think super-regen? That way you get very high sensitivity with one RF stage; and if you turn up the reaction any more it's transmitting! Many military VHF sets used this principle.

The disadvantage, of causing interference to neighbours, hardly applies when you are backpacking. (I have carried car batteries up Monroes before now and I DON'T like it!)

Re: Help? Mod for IC-215?
By: Jason Baack, N1RWY [baack@maine.edu]
On: Thu 05 Mar 1998, 15:32:09 GMT

Jason was looking to put his IC-215 on 144Mhz as a packet rig. For those who are unfamiliar with this rig, it is a 3 Watt, 15 channel FM rig for the 146 to 148 MHz band. It is portable, and runs on 9 "C" cells, or 12 volts DC.

Before attempting to convert the rig to the lower end of the band, I would advise checking the speed of the transmit/receive switch. I looked into using this rig as part of a sampling autopatch and found a substantial amount of delay when switching between transmit and receive. I determined that the sampling time would have to be far too long to give acceptable performance as a patch, and so I suspect that it would not perform well in a packet application. The TX Delay would have to be set to a fairly long setting, and this would not solve the probem of the delay when going back to receive. I expect that many of the received packets would have their headers clipped off by the time the 215 settled into receive mode. I would advise making some quick checks with the radio on a simplex frequency to see if it would give acceptable performance as a packet station, before I got too carried away with converting the rig to a new frequency and ordering the crystals. The amount of time the rig takes to switch is determined by C56, a 100uf cap. Altering this value may speed up the switching to an acceptable time.

Concerning the frequency conversion: The European and Asian versions of this radio operated in the 144 to 146 Mhz region. The diagram shows that crystal X1 is 11.155 MHz in the North American version, and 10.245 Mhz elsewhere. There is no mention of a difference in the crystal formula between the two versions, or other parts changes. I suspect that the coils and caps could probably be tweaked into the right range without any additional component changes. For that matter, a new trans/rec. xtals might do the job without changing the mixer crystal. I guess some experimenting is in order...

How the heck???????????

NOT!!!!!!!!!

Lets get something straight .... water has NO POTENTIAL CHEMICAL ENERGY. Please note chemical. If it had potential chemical energy, rivers would explode on contact with a miserable cigarette some bridge crosser happened to toss out the window of car, or at least flare up. Its also guaranteed that steam in nuclear plants or coal installations would ignite in explosions as yet unrivaled. Sure there are things that react with water, buts it because the potential lies within the other chemical, not water! Water is about as stable as you can get for generically available chemicals. Many like to point to Chernobyl about how water will burn. But they miss the simple fact that the core was so hot, that enough energy was available to destructively breakdown water molecules. This in turn led to hydrogen and oxygen, which upon cooling to a few thousand degrees, ignited and burned. So it took alot more energy to break it down than it provided on recombination.

If you dilute gasoline with water, you have only increased the amount of the "mixture" necessary to move the car, cause water DOES NOT EVER BURN. Its nuclear potential is out of the question in a car motor, and largely out of question as of yet even in nuclear physics. Thats even if a modern fuel injected car would run at all with water, since water sticks together and doesn't dissolve well in gasoline, it will most likely be the only thing coming down an injector for several seconds, if one is lucky and fuel comes down at least two or more injectors of other cylinders, maybe the engine will run. You can increase moisture content in alcohol fuels or fuels with alcohol content, but it only reduces power, once again requiring either more fuel or that you live with less power.

I guess you view "Chain Reaction"'s energy source as a possible modern energy source. Get REAL! Where do you get this stuff???? I guess I'll never know.

The difference in frequency between those second conversion crytals may
mean nothing.
10.245 + 0.455 = 10.7
11.155 - 0.455 = 10.7

Considering that, it seems likely that the first IF is 10.7MHz, and the
different crystal means nothing. I would assume that there is a filter in
the first IF, and with luck the actual frequency is marked to verify this.

If the crystal formula does not change from version to version, then
that's further verification that the change in crystal frequency is just a
different way of doing the same thing.

I have a Fascinating Electronics Weather Station for sale. It works great but I now have other priorities and am not using it.

It will display all current WX conditions on a PC. I have the Windows display software that is included. This software allows display, logging, graphing and calibration of the sensors. With software calibration, there are no pots or controls to mess with.

The software also allows for ?alarms? to be set should a parameter fall outside a set point.
There are 5 temp sensors, indoor/outdoor humidity, barometer, wind speed/direction and a self-emptying rain gauge.

All cables to sensors and the PC interconnecting cables are included. Also all instructions and documentation that came with the station.

I am asking $ 599.00 OBO

There are problems with the superregen beyond it's radiation problem.
It's good for receiving AM, and okay for receiving wideband FM. But it
won't work for SSB or CW. It also has very little selectivity, which is
an advantage when you are not dealing with stable signals, but not too
useful with narrowband modes that are stable.

Of course, there were all those Heathkit "lunchboxes" with simple
transmitters and superregen receivers that were fairly cheap and probably
did do a lot at one time to get people on the VHF bands. They did provide
a cheap means of getting on locally on six or two, and of course when six
opened up a few watts was good enough for DX. I don't know how easy it
was to sort out the stations when the band was good with a superregen
receiver.

Probably, the use of a superregen (and there was one featured in QST a few
months ago for six meters, though it appeared to be nothing new) pivots on
what you want to do with it. If there is local AM six meter activity
already existing, or you can talk some others into getting active, then a
superregen might be okay and it sure would be a simple start.

But if the local activity is SSB/CW (or even FM), or there is no local
activity, then you really need something better. If you wnat to work
non-local stations, you also really need something better.

While I prefer 40m, a major problem is that I'm going to be above
tree line and therefore will have a tough time finding two supports
for a dipole of any length. I think I'm gonna have to go vertical or use
a rigid
dipole made from commercial mobile whips or aluminum tubing.

I recall an old ARRL Handbook having photos of a team of real mountain
climbers operating qrp from some peak - wish they'd gone into detail
about their antenna!

And thanks to everyone for all the suggestions!

I've never had much success with super-regens. I'd say that a direct conversion Rx would be better, though you may need an RF preamp. However, you could have it running off the same local osc chain used in the Tx.

Alternatively, an NE602 converter ahead of a simple superhet would work OK.

Dang, days away from the WI QSO party and the HW-101 looses it's LSB. I suspect the XTAL for lsb has died, USB works fine and I can see nothing else that would effect this circuit.

There are two Xtals switched in line for usb/lsb usb tx works fine but no lsb rx or tx, in the lsb position I get very poor quality AM so my only conclusion at this point is I am not beating anything against the IF to produce audio freqs.

Any thoughts on a quick fix?

Bob,
The TUN mode puts out about 20W on my TS-820S. You use it when you first tune up to set the ALC level. (Switch to TUN, meter to ALC, peak it with DRIVE, then switch to IP and dip PLATE...still in TUN. Switch to CW, meter in IP, dip PLATE, meter to RF, max with LOAD, back to IP, dip...repeat LOAD and PLATE as required for maximum smoke.)

While in TUN, you can adjust any antenna tuner you have in-line for min. SWR. You can also use the TUN mode for plotting SWR curves for your antennae. Otherwise, it's only there for peaking the ALC level. (NOTE: You may have to back off on the carrier level if the ALC goes off scale high, which it may do on 40m or 75m; otherwise, mid-scale seems to be adequate.)

Hope that helps. (BTW, the Kenwood site has all the service bulletins for the 820, some of which you may find useful...especially if your digital display goes haywire when operating on 10 meters!)

Ken-

I used to use the thick aluminum backed Duroid all the time
when I was involved in designing 6GHz power amps for
sattelite communications applications some years ago.
(at California Microwave, Equatorial Communications,
Contel ASC, and GTE Spacenet)

In the lab (and also in production in some cases) we achieved a
ground connection by tapping a small (0-80 or 1-72) screw into the
aluminum and then soldering to the screw head.

Etch the PCB pattern of your choice into the copper making
sure to allow a small pad at locations where you want to
make a ground connection. Then drill and tap a hole through
the teflon into the aluminum. Put in a short brass screw and
solder the screw head to the copper pad. Just make sure
all the connections are very short.

For small power GaAsfets with flanges we machined out a small
cavity for the flange (which also was electrically the source)
to fit into. Then the fet flange was just screwed down. The
aluminum backing makes a great heat sink (espicially if you
bolt it to a big finned heat sink).

I've also used conductive expoxy to make connections to
the aluminum, but I never really found it too satisfactory.

An alternative to "hardwired" grounds for bypass capacitors
which works rather well is to provide a virtual ground by
using either a low impedance quarter wave open ended impedance
inverter, or for wider bandwidth, the radial line version of
the same.

Hi there.

I found an interesting article on the net.
It is a 70 cm transverter that looks quite easy to build.
My only problem is that the pictures are almost impossible to see
because
of the low quality. The article is from QST, August, 1991.

Does anyone have these pictures scanned with adequate quality, so that
it is
possible to see how the thing is built. It is always much easier if one
can see the
the stuff on pictures (at least for me).
If you have them, could you please e-mail them to me ?

George,

That is the crux of my problem. I can only get about 1 to 2 watts out on TUN.
I have gotten info from this post that leads me to go look for a pair of resistors
that get switched into the screen grid circuit in the TUN mode. Then I can get
it back to where the level ought to be. If I had 20W I'd be very happy. It is
apparent that it is sick. Now I'll get it well.

I also located a source for a service manual. A money order is going in tonight's
mailbag from the right coast to the left coast.

For a lot of the rest of the folks; I know how to tune a rig. Been at it a little while,
something around twenty years. I have never had a solid state HF rig. I have
used a few. I prefer my tube finals, Thank You.

David,

I have to throw in my 2c, I mean 2penneth worth as I have a close
working colleague that has witnessed a GEET processor in operation.
May I make a suggestion. As you're in the country of origin of the GEET,
may I suggest you take your blinkers off, dial-up the GEET.com web-site,
get yourself along to the next open display/lecture in a town near you
and simply observe.
Let's just say I'm intending to order a new Z28 Camaro later in the year
when the retrofitted 350 V8's have been fully sorted and will be
bringing this car back to England via the GEET site in Utah.
A damn long way to drive for something that does'nt work especially as
I'm buying the car in DA.
Tell you what I'll do, to help you off with the blinkers' If after a
personal demonstration you're not totally convinced of the GEET's
ability to live up to the manufacturers claims, and yours, I'll
personally send you $1000.

I don't know what type or value you lead-acid battery is, but I have never ruined one that I know of. Automobile batteries hold up under a wide variety of conditions and generally last around 3 years. Certainly a fairly low amperage charger at slightly more than the rated voltage should be satisfactory. Trickle chargers can be left on the battery indefiniately.

Here in the USA, 12V lead acid batteries are the normal automobile battery. Charging them with 13.8 VDC with an automatic charger is pretty common. These chargers put out about 8 to 10 amps maximum and cut back to no charge when the battery is charged. I set my charger on 13.1 Volts for long term maintenance and 13.8 Volts for a good charge.

HELP ?!
We still need a few items to complete the new repeater for Piscataquis County, Maine (if you've ever been here you know we're one of the few places on Earth that still need a repeater! :)

Looking for:

16 to 20v, 20+ amp transformer with 115v primary.

Rack panels, 5.25" to 10.5", what have you got?

Enclosures, one 4x4x15" or larger, one 7x10x13 or larger.

20 feet of RG-214

If you have any of this stuff, please Email, and include condition of the item(s) and asking price. Thanks.

saturday.....March 14, 1998
Its the second Saturday of the month, coming up this Saturday. Fontana
Swap Meet at A.B Miller High School, 6821 Oleander Ave., Fontana, Calif.

Take the 10, San Bernardino Freeway east to Citrus
Ave, North to Baseline, turn right to Oleander and north (Left) to the
School.

Pomona Freeway Eastbound to the 15 Freeway, North to the San Bernardino
Freeway then follow the directions above.

Time: around 6 AM to 11 AM.

This event is sponsored by the Inland Empire Amateur Radio Club.

Last month and the month prior was a "Rain Out", so this Saturday, with
the closure of De Vry Swap Meet...should be a sell out!!! Bring your
"Goodies", See you there..

Has anybody ever played with this in a ham context? Other
than the obvious applications, like IDing WBFM microwave
stations, it occurs to me that the available decoder
chips (e.g. TDA7330, a Costas Loop PSK demodulator) could
be the basis for some very simple, very cheap data radios.
They just wouldn't be very fast...

That's correct. It is also true that piston engined aircraft have used water injectors for years to increase power and range. The water is not used as a fuel, of course. It's certainly not an octane booster. Still, for whatever reason, a fine mist of water enhances the action of the fuel/air mix in large piston engines. (I've never heard of it being used on small engines.)

A few years ago, my brother added a water injector system to his hotrod (65 Dodge van) , and noted a slight difference in how the vehicle ran at high speed. At lower RPMs, not much difference was noticed. Eventually, he decided that it was more trouble than it was worth (he kept forgetting to fill the little water container) so he yanked the system out again.

I understand that this is not exactly "on topic". It's just a side-note I thought I'd throw in.

I posted a request a while back about a GE UHF rig, I've found out a bit more info, so maybe someone can point me in the right direction as to how to mod it for ham use.

- It doesn't appear to have a model name, such as MastrII or whatever.
- It has a seperate control head from the main box, with 2 digit LED displays, 3 of them, push-buttons for volume, squelch, channel select, scanning and adding/deleting channels from the scan.
- The combination number is N3UU2N040ZB
- It appears to have been made around 1982, by the date codes on the chips
- It's microprocessor controlled, synthesized freq. control
- It has a nice diagram of the unit on the inside of the top cover with the label "UHF SYN TOP COVER", info on test connectors and various alignment adjustments

I'd like to get it running and, if it can do full duplex, set up a UHF repeater. If it can't work as a repeater, it'll probably make a decent UHF mobile or base unit.

So, if anyone can help me figure this beast out, I'd really appreciate it!

Thanks in advance,
-cj

I tell you what, you ruin your car, then. And when your finished and trully running with GEET I'll drag race you down the road of your choice, with a 231 Camaro. And if its GEET, I guarantee myself a victory. You said????? If you beat me, your running gasoline like you should. If you loose, then I'll know your running GEET.

Here's what it does (I've owned a turbo and know the tricks), it cools the air entering the engine, therefore the computer or human hand tuner can run a more aggressive timing profile, higher boost, and more fuel. But, as you say, its a fine mist, not GEET. Many RV's have such systems installed just to reduce detonation during hard climbs.

Being also a person from the part of the country where the best thing on a Saturday night is a truck pull (I really do not enjoy professional sports at all, except NASCAR, NHRA) or a mudfest somewhere deep in the woods, I have quite a bit of knowledge of how tractors used in tractor pulls work. The deisel SuperTractor class, unlimited of course, injects water at the end of the track to cool the cylinders and pistons, or even with normal watercooling, the engine would just melt.

But none of these applications mentioned as of yet are equivalent to what GEETS claims, which is power from displacing fuel from a mixture and replacing it with water.

cj -- many years ago I worked for a GESS GE Service Station. We had ALL the manuals, service bulletins, etc. I suggest you contact a GESS and ask them. Unless GE changed their nomenclature system, the number you found *is* the model number: N3UU2... That number tells it all: 1st letter - model (Mastr II, Mastr Pro, etc); 2nd digit - i don't remember; etc, etc

I jumped over to the web quickly and did a search for GE mobile radio. Got a number of hits. You might want to start/try there.

Good luck

More GEET:

I read their page fully and all the so called "testimonials". It reads like a comic book. The stupid antics they pulled, etc. (yeah right) and in addition to that, none of the engines were tested under load. I can assure you they would have stalled it with the simple application of a clutch, in particular with regards to the 350CID Chevrolet motor and its accompanying Camaro body and transmission. How come no dyno test? Very few make these claims without dyno readings to back it up. If the observers had known anything at all about engines they would have requested exactly those specs. A modern computer controlled, sequentially fuel injected push valve engine can run without a noticeablely smelly exhaust after warm up. So what? Even funnier than all of that, was the complete lack of control systems for the fuel processor. I couldn't stand it any longer .....

The next funny thing is the control system for the GEET device. No electronics were mentioned, no connection to the throttle assembly, as described anyhow. That means one of two things, when the engine suddenly demands a large amount of power, it will lean out, stalling and perhaps detonating to the point of engine destruction, or two, the fuel processor will take minutes to adjust, and by that time the motor will have spewed tons of sorry old HC's out the exhaust.

On to something with content applicable to the group:

Anyone played with the Part 15 SS equipment available commercially? What kind of pricing are we talking here? I live in the city, and am a apartment dweller, which also applys equally as well to my fellow networkers, so foghorn desgins just aren't gonna work for us. Spread spect. will be the key until I move out to the country side. Prices, companies, experiences are welcomed.

Excuse me while I laugh till I cry about GEET's fuel processor,

Pearce

I converted a single channel Maxon 49 megr to 52.525, I rematched the rf amplifier to a 49 meg. cordless rubber duck and added an MRF237 3 watt output stage. All this was stuffed in a GE PE handi-talkie case for less than 50$ the original GE battery can easily supply 3 watts for extended transmissions. Since 1992 I have used this HT to talk to Maine, VT, Conn. NJ,NY, Pa Ca. Co. Tx, and Oklahoma from Central Arizona, All of these were done on simplex, no repeaters all with the 12" rubber duck antenna. Compared to my Azden AZ-61 synthesized HT for 6 meters I have had less problems and much more fun. Although this is only a single channel unit, I still bring it out during really good sparadic E openings to work towards my 6 meter HT WAS.

allen,

welcome back to ham radio and hombrewing.

as was mentioned, check out the NorCal home page. if you join one QRP group, i'd make it this one! they are even redoing some of the classic simple transmitter and receiver projects such as the Herring Aid and the Tuna Tin, but using currently available parts.

http://www.fix.net/norcal.html

plenty of links for suppliers.

embedded research has a transciever a bit more involved than a single transistor. but i assembled mine in about 2 hours and i'm slow! it is called a Tixie and is an 80m cw xtal controlled transciver with about 0.25 W out. incredibly, it has a neat keyer chip included. the price for the board and the chip is $12.50 - you supply the rest of the parts.

http://www.frontiernet.net/~embres/

far circuits

http://www.cl.ais.net/farcir/

has lots of pc boards for sale, with references to the articles from QST, QRPp, 73, ARRL Handbook etc. very nice to do business with.

homebrewing and QRP are alive and very active. let me know if you want more info. also check out my web page:

I used to "move" crystals a little bit by grinding them with toothpase or toothpowder to make them slightly higher in frequency. We put graphite (pencil lead) on them to move them down. These were FT-243 type which were pelentiful 40 years ago. There was a lot of military surplus stuff and to have several cigar boxes full of crystals was not unusual. Today's small crystals can't be taken apart and messed with.

You might have some luck finding cheap or free crystal at a two way radio shop. Sometimes they have boxes of them left over from when they used them in all two way radios. Today's radios of course are senthesised and are just programmed on a computer.

Good luck. Walter

Source record: 85112

Hello Tim,

No LSB in a HW-101 can be from several sources:

1) Dirty mode switch
2) Bad V16B (12AU7)
3) Bad R11, C5, R7
4) Defective LSB crystal Y2 (3393.6 kHz)

Does it transmit OK on CW? If so, then 1) and 4) are the most likely culprits.

Note that one section of V16 is used on USB and CW receive, and the other section on LSB and CW transmit.

E-mail for more ideas if you need them.

I need some help identifying a surface mount part made by MOTOROLA.
The package (unknown type) is approximately 1/4" square, with two opposing leads. A notch on the top of the package is above one of these leads. The top of the package has the MOTOROLA "M" followed by 425. I believe its surface mount diode, but not sure of its electrical characteristics.MOT's web site has some PDF files that I looked thru, to no avail. Can anyone provide more details on this part? Thank you!

Bill

Did anyone do any informed and qualified research on those magnets round
the fuel pipe (at ?60)?

I read the instructions. IF you followed the instructions you would get
better mileage WITHOUT any magnets nor anything else. Assuming most
people drive uneconomically, which all males under 45 in Edinburgh do
for a start.

Hard to believe, but Scots (and maybe others) pay good money on fuel to
heat their brake linings, whilst keeping their place in the commuter
hatch.

> I really like the 'clean' sound of a DC RX I've built, I have a DSB
> generator that I would like to add and make it an SSB tranciever,
I assume your dsb generator has a vfo and is not single frequency, crystal controlled,
and that you want you "new" rig to be tuneable? Proceeding on these lines...

Assuming your DSB generator is a mixer with audio and vfo inputs, output amplifier and output filter/matching for an interesting band. Fiddling between the vfo and the mixer, filtering it,
mixing it etc will just give you a shifted and attenuated input to the mixer. You will still have DSB
out from the mixer.
You will need to add things to convert your DSB generator to SSB, if you want to
proceed with modifying what you have, by the crystal method or the phasing method. You have bits
that can be used in either approach. For crystal method: make your vfo fixed (a crystal), and strip the sideband with crystals at the output of the mixer, then mix again at the output of your crystal filter to the freq of your choice, buffering, amplifying and filtering as you go.
For phasing instead, you make another mixer such as you have, keep the vfo you have and feed it to a phase splitter, and then take the phases from this to each of the two mixers. Phase split your audio and poke each phase in to the two vacant input ports of the mixers, combine the outputs of the mixers. Add ample doses of amplification, filtering and buffering as you go, with the added excitement of keeping everything physically and electrically symmetrical to have 'balance' which is needed for good carrier supression. Phase splitting comes in many flavours. Something like "Solid State Design for the Radio Amateur" ARRL, will help in all of this.
On the other hand (the third hand), build the dsb transmitter for 3 watts and enjoy it for its capabilities, then you can reuse all the bits later if you just must have that ssb.
Dave

I do not accept that manufacturers make component changes between
different versions of their products without a valid reason for
doing so. I would not want to be the one that purchases a new set
of communications crystals at todays prices, only to find that
there is something in the oscillator chain that is desensing the
receiver, or causing an internally-generated spur on my new
channel. If ICOM alternates between high-side and low-side

injection for the 455 kHz stage, then I must assume they know what they're doing.

I would also like to clarify my remarks concerning the crystal formula. I did NOT state that there is no difference between the Euro/Asian IC-215 and the North American version. What I said was that the manual _makes_no_mention_ of a difference. The only place the difference in the X1 crystal frequency is noted, is in the large wiring diagram, separate from the manual. The manual contains the crystal formula, and it is possible that the manual only reflects the version of radio that it was printed for.

I suspect that the radio would operate in the lower half of the band with only a re-alignment, and I stated that in my origional post. I do think that recommending further experimentation and invesigation into the matter before proceeding is warranted. I know that I'd do it before parting with MY money!

For the record here's the crystal info for the 146-148 MHz North American Version. Perhaps an owner of the Euro or Asian version can post his formula. I would advise working out all the crystal harmonic and mixer products involved before purchasing out-of-band crystals.

It was specified in one of the (2 part) QST articles last year.
I don't remember the voltage, but the DC supply is keyed and shaped.
It's not HV by vacuum state standards, but it's in the range you'd
expect for putting 350W into 50ohm ... and some extra out the heatsink.

> 2. HOW come these things will work fine with 2 WATTS of drive and
> provide 500 WATTS out ? Dont these things self-destruct from RF
> feedback?

Fuzzy memory here ... I think they key the memory as well as the
QRP rig (LO); the switching mode finals create square-waves at teh
frequency of the LO, with the output tank and low-pass triming the
harmonics.

One key to avoiding problems is they packaged it in 3 or 4 separate
project boxes... instant shielding/separation !

> > efficiency), they are useful for modes requiring no linearity, such as
> > CW and FSK (or FM). For me, that meets the entirety of my operating
> > modes, HI!

Hmm. I don't think FM would be welcome down low enough that the
switchers would be happy? QRO RTTY is silly when CLOVER (or *tor?)
can be decoded RST=511 or worse, but it's an idea. If the switchers
can switch fast enough for 10m / 6m hi hi.

Gary ke4zv answered David W6MIK (no call given?):

> >I need some real help with trying to narrow the receive bandwidth of my
> >HTX-404 HT for 440 operation.

> Dave, narrowing the bandwidth of your HT will not increase sensitivity.
> The only reason you'd want a filter in front of the receiver is to reduce
> intermod, IE pager crud, which your HT may suffer due to overload

The Rad-shack HTX202/404 were some of the tighter front end HT's
ever made (outside of moto's public-safety models), so it's unlikely
his problem is pager crud, but rather other in-band repeaters
physically nearer than the 40mile DX he's trying to hear and on
adjacent frequencies?

Always go with antenna gain first, as it works on TX and RX.
The Beam will help you both ways, and give you a null for the locals
too. Look at where your local high-end repeaters are and that will
help you determine whether you need to maximize F/B or Forward Gain
(which is more important: null to rear or low side lobes?). Even a
single quad loop (with nice deep side nulls) might be enough add
to your selectivity.

I like the helicals; my mobile has a set (triple?) built in and
doesn't mind driving by the police radio shop under the downtown
pager antennas (known locally as intermod alley). But the
suggestion to have them after the preamp sounds familiar.
(If they'll take the power, having them switched into the output
path of the brick would be a good idea too ... just to prevent any
harmonics or many spurs from escaping ... but that's adding more
Tx/Rx relays.)

Large group of 19" rack panels up to 21" tall. Will sell
CHEAP, need to clear these out of my storage building. Let me know
what size you need.

Large group of NEW 19" aluminum panels 14" tall. cost $47
each, sell for $20 plus UPS.

You will probably blow one or both supplies if you hook them directly in parallel. A large diode in
series with each supply may
permit load sharing without harm if you can adjust the supplies accurately enough to get load
sharing. Typically one supply will
current limit and the other may then regulate.

Hey, I want in on this deal. I can always use a fast $1000.

The stock factory 350 Chevy small block (1998 Z-28 spec)
achieves a brake thermal efficiency of 38.4% by actual test
cell measurement (SAE measure). Brake thermal efficiency
is the ratio of shaft output energy on a dyno brake to the energy
contained in its fuel (18,000 BTU per pound).

The absolute Carnot cycle limit efficiency for this engine
(assuming no breathing restrictions or mechanical losses
or combustion inefficiencies, which are, of course, impossible
to achieve in practice) is 57.4%. This is the engine's so-called
Air Standard Efficiency. So the stock engine delivers 67% of
the theoretically possible efficiency in converting its fuel's
energy to shaft output energy. And so any claim that efficiency
can be improved more than 33% is bogus on its face.

If the GEET device could actually do what it claims, IE improve
the brake thermal efficiency of the small block Chevy engine by
300%. The engine's brake thermal efficiency would be 201% of
the theoretically possible Carnot cycle limit, thus violating the
basic laws of themodynamics. And it would represent 115.2% of
the total input energy contained in the fuel, which would make it
an over-unity perpetual motion machine.

Since I have faith in the laws of thermodynamics, and I believe
a perpetual motion machine is impossible, I have no doubt that
I can collect an easy $1,000 here.

Hi Jim,

Try the latest Communications Quarterly for a faily easy-to-build 6M AM
rig. It is NE602 based and puts out about 4W. I am collecting the parts
to build one. Should be lots of fun!

No reason to ask Americans what the Mexican rules are.
It is like asking your friends who live in Mexico
what the U S rules are. Lots of speculation.

Call the Mexican Embassy. You can look up the nearest
one on the INTERNET.

If you are not successful in this, Email me and I will
send you a long list of Mexican websites and bookmarks
for NETSCAPE, and you can search these.

However, if I remember correctly, it was very expensive
for a permit. And you may have trouble getting the
equipment in or out of the country without paying a
tarrif..

Like I said, call the Embassy. And try to get something
in writing..

The Chevy 350 is an even nicer motor than I always played it up to be ... as you know I don't doubt your numbers at all, however, where in the world do you get the effeciency numbers? I have a few other motors to look up. This would have been useful for my posts.

Hi
I am looking into the possibility of using 4x MHW720A amplifiers for
easy 70cm power amplifier.
I have 1W RF drive, and since each module needs only 20-100mW drive I
will use some resistive input pads.
The output must be combined in some way...

I will use a unitrode UM9401 PIN diode with quarterwave lines for output
switching and BA282/MPN3401 switching diodes for the input circuit.

any ideas how to build the power combiners as easy as possible?

Read the www.geet.com "testimonial". You can tell its a fluke. But thanks for the incompetent insult anyway. Gary even brought you the math, I guess because of the 100HZ music transmitter type mindset, you can easily imagine whatever you want. I'll even offer to run the simulation on my machine of your radio, as long as you draw the circuit and compile it into a netnode list, along with all needed models of devices (standard of course).

>All the other answers I have read sound like the stuff I got when I said I had
>made a radio that had transmitted music on a 100 Hz bandspread.

Another good one. Ever heard of the Fourier Transform? Try it sometime. Reread my offer.

> It sounds also like the injunction argument that broke Lee DeForest.
> You may remember reading about him. He claimed to have invented
> a thing (he called it an AUDION) which could amplify audio.
>

In his case, no one understood the physics at the time, and even more than that, the "established base" wasn't open to anything even logically presented because at the time, the best place to be was on a board or academic position. Comfortably I may add. How else could you explain the overlooking of real proof that audio amplification provides?

On the other hand, the fuel processor is a thing much different. There isn't a lick of proof whatsoever. The proof presented so far has been here say by a visit to a "installation", then a grand excuse of why the car so equipped couldn't make it to the demo, and measurements taken from equipment that was neither tested for calibration, accuracy, or tampering. And further, enough tests were not performed. Get real, no dyno test. The control system for this device is non-existant. How does it adapt to the engine needs, tell me? And finally, after failing proof tests of validity by measurement, it fails the laws of physics miserably. Maybe physics could be rewritten if all the true proof tests were passed, but it couldn't even do that. So there, I am thinking, you are accepting an opinion of an uninformed and ill equipped observer, and for some reasons the same instincts that for some reason tell you that you can build an AM radio that transmits music in 100HZ bandwidth or less take over and prevent you from thinking by giving you a headache.

Now, please, trully start thinking!

> The court agreed with the arguments by the supposed authorities of the day,
> who hadn't assayed the subject, but had just read it and decided it didn't work.
>

Engineering is engineering. The guy is either creating a nuclear reaction or its bogus. You can't extract more chemical energy where there is none, and a fine mist of water would never increase engine effecieny greatly, it only modifys the temperature of the intake air flow, therefore modifying possible timing curves and boost delivery curves on turbo motors, and even further down the line, allows more fuel to be injected into the engine. Its detonation elimination effect is about the only true effeciency improvement that it garners, because with less det., you can run more agressive timing, improving the use of your fuel.

> We call the Audion tube (valve) a Triode, today.
> All CRT tubes on TVs and PCs are descended from the man who was ordered
> by the court to stop selling AUDION bottles.
>
> You sound like you are trying to join the few who do think, and I commend
> you for it.
>

I'm sorry, but that guy has not thought a bit, nor has the president of GEET, nor has the guy who built the thing, except for turning a profit from people who aren't engineers. And finally, neither have you. I don't deny that inventors can come up with some impressive stuff, but the fuel processor is not one of them. And looking at your homepage, you have alot of bogus stuff also. If your idea is so impressive about the pulse engine, try it on a supercomputer. I'm sure someone can throw away the money for you to try it, if your proposal was well worded. Heck time is so cheap now, it really doesn't have to be That reasonable. These simulations are completely impartial, applying only the laws of physics that seem to apply to every other thing on the planet. Would you maintain that there is a better laws of physics? Then that could be tested too. Establish them, program a new simulator, then simulate your engine. Then plug in a real everyday engine. The fact that the real engine no longer runs should prove enough to you.

Sensible advice, if followed with EXPERIMENTAL investigation.
I have read this whole off-topic thread, because it would make a hell of a
power-boost for field day and the more serious scenarios that we train for,
but in reading this thread, I have seen NOT ONE SENSIBLE answer
outside your post.

All the other answers I have read sound like the stuff I got when I said I had
made a radio that had transmitted music on a 100 Hz bandspread.

It sounds also like the injunction argument that broke Lee DeForest.
You may remember reading about him. He claimed to have invented
a thing (he called it an AUDION) which could amplify audio.

The court agreed with the arguments by the supposed authorities of the day,
who hadn't assayed the subject, but had just read it and decided it didn't work.

We call the Audion tube (valve) a Triode, today.
All CRT tubes on TVs and PCs are descended from the man who was ordered
by the court to stop selling AUDION bottles.

You sound like you are trying to join the few who do think, and I commend
you for it.

Me, I always get a headache when I try to think.

That may be why I can't sell my inventions. See my URL.

Good luck

Unless the rules have changed since I was there, you must go
with your original US license (any class), your ID (passport is
best), and your "tourist card" (visa, generally good for 6 months
for US citizens) to "SCT" (Secretaria de Comunicaciones y Transportes)
... excuse me for not bothering to insert accents ... to apply
for a Mexican reciprocal license ... you will need copies of all
of your papers to leave with the officials there and you will have
to pay a modest fee (it was about $40 for 6 months as I recall).

You will receive authorization to operate in Mexico, using a *MEXICAN*
callsign (which when I was there consisted of XEx concatenated with
your US callsign, where the little "x" is a number for the callsign
region ... I got mine in the 2nd Mexican call district, so my Mexican
callsign was "XE2WA6VSE" ... NOTE this is NOT a US call operating
portable in Mexico, it is a *Mexican* license/callsign and the US
rules
and restrictions of your US license class do NOT apply to you *while
you
are operating in Mexican territory or territorial waters* ... I am a
Tech+ in the US ... in Mexico I had full priveleges on all parts of
all
bands, all modes. (the Mexicans are more sensible and progressive than
many Americans, that's why I married one :-)

Of course, some US hams think using perfectly legal Mexican priveleges
while in Mexico is "cheating" somehow, but that's just sour grapes
because they don't think a "lowly" Tech+ should have HF privs ...

Note that this is how it was a few years ago ... it would be good to
check with your closest Mexican Consulate to see if they can provide

more current information.

You have a Syntor. The combo number tells all, but unfortunately I
don't have my cheat sheet which decodes it handy here. Order a
manual for the radio (the manuals are still available), and it will
tell all.

Wilkinson power combiners will work if you restrict yourself to only
part of the 70cm band.

The Z-28 numbers come from actual measurements in a test cell (dyno).
We were baselining the engine for a showroom stock class car. Air
Standard Efficiency can be calculated using formulas in "The Design
and Tuning of Competition Engines" by Philip H. Smith. The energy
content of fuels can be obtained from the CRC Handbook of Chemistry
and Physics. Drag calculation formulas are in the Bosch Automotive
Handbook (which also has the fuels data, and Cd numbers for a cross
section of vehicle bodies).

The Otto cycle engine powered auto has been around for a century. It is
a mature technology. There is plenty of engineering data available for it.
Unfortunately, wild claims like those being made by GEET have also been
around for nearly a century. And they have remained claims, because they
are not based on reality. They are either outright fraudulent scams, or the
work of some enthusiastic amateur inventor who doesn't understand
thermodynamics or how to do careful quantitative measurements.

Source record: 85054

See Solid State Design for the Radio Amateur, ARRL, where there are
numerous circuits for cw and dsb
from 160m upto 70cm. The circuits can be built progressively, begining at
the low end, and VHF will be
no harder than HF, just smaller. If anything, there is more mention in the
book of instabilities in HF circuits and their cures, since VHF components
are often used in the HF circuits and they are more likely to "take off".

>(Typical of the Breed)

>Looking for both around
>Tulsa OK, USA
I'll go check it out.
PS. Gary, I made my 1000 buck offer in good faith to only one person and if you flash back you'll see that it was on the condition he go see a GEET processor in operation with his own eyes fitted to a internal combustion engine, one of the GEET 5kw generators will also be included in the offer, and yes, I'll let you put a full 5kw load on it then connect it up to the dyno.
Go see it in the flesh, then come back and make us laugh.

Phil G4ZOW

PS. I'll leave with a nice anecdote:
When cold fusion can produce_reproduceable_ results seen by many researchers, then it will be accepted, just like plate tectonics and the existance of meteors.
But not until then.

Don't think I'll be spending 1000 dollars this week.

Or they might fall into the category of the FISH (sp?) carburetor. Many of the
people who tried to get one back when had their orders returned by the USPO
marked "fraudlent". My father got such a reply.

The brother-in-law of Fireball Roberts worked in a machine shop in Fla, and
would show anyone that wanted to see it, how he had a Fish and an Offie carbs
on his car.

He said Fireball had had 2 fishes on his racer but they were stolen, so he came
and traded SuperChristian an Offie for one of his.
I learned of this from when I said that the "suppressed invention" myths were
just that. I offered the Fish Carb as an example. The overweight guy at a
machine said that the existed and told the story.
I asked another guy if the fat bou knew what he was talking about.
"He should," was the reply, "he's Fireball Robert's Brother-In-Law."
The man said he had seen the Fish carbs in the Bonneville that the Bro-in-Law
drove.

But we all know that hose suppression stories are just myths.
Read a history of Brig Gen David Sarnoff, who was as bad a robber baron as
any that ever fortified a hill in medieval Europe.

The Fish Carb can be found in the Patent Office doc's.
It's a boiloff tech.

The HEI, or High Energy Ignition, I think i've already said on this thread, was
another thing like GEET when it came out. Now you buy a new car, and it is
there already. The HEI was being sold in fairs and carnivals, For God's Sake,
to try to recover the money the guy had in patenting it.

Back to GEET: People, try to keep an open mind. Investigate for yourself.

Almost every breakthrough in history had been Poo-Poo-ed by people who
later said they were some of the first to recognize the wonderful new thing.

Read the history of OTTO, who started the whole thing. Same story.
Read the stuff at my URL. Same-oh, Same-oh.

Sheesh.

WILD ! ! HOW CAN I PASS UP SUCH A GENEROUS OFFER ? ?
Easily. If I put years into something, I want something out of it.
My ego does not require your approval, but if you want to come to Tulsa and
work on it with me, after signing suitable protective documents and then
help me get the financing to build and patent and prove and sue the sox offa
the thieves, then,
COME ON ! !

One of the hallmarks of any prolific inventor is paranoia. It is a result of
bitter experience. I have had several inventions stolen from me.

I got better sense now.

>>All the other answers I have read sound like the stuff I got when I said I had
>>made a radio that had transmitted music on a 100 Hz bandspread.
>

FFT is a wonderful thing if you have the numbers to plug in, but if the numbers
don't exist yet, where they gonna come from? Experimental Data, thet's where.

"Oh, that use scientific fact, and what the elegant word,
"Against unmitigated event that actually occurred?"
I built one. It worked. Then I tried to tell it to radio club, and was told it
can't be.
I had to sell the parts when I went broke, about '78, for rent money.
Lotsa inventors are like me. Sad, that.

I'll try, I really will. I promise, even if it gives me a headache, like it
always does. Meantime, you might like to look up Fred Teal's brother, Gene, who
is a lot like me, but he did his thing with rejetting a carb, so lean you
wouldn't think it would run, and took it to ffairs and all he got was people
trying to steal it from him. There is an annual inventors fair, in some place
like Lenora or Lenexa Kansas, way out west of the state. He was there several
years running. His brother Fred has/had a farm in that area, why I mentioned
him. You might find him on the net, even.

Then laws of fizzix is revised all the time. Sheesh.
Inventors are doing stuff all the time, which later gets first derided and then
applauded by authorities.

Hell, man, I have enuff computers around here to run failure predictions on,
but all that means to an inventor is that there ain't enuff math in the model.
That don't need a Cray. It needs math the Cray ain't got neether, by gar.

I am reminded of the thing a sailor kinfolk told my mom, for her to put in the
book she never finished. They had a huge thump on deck once during WW2,
and huge thumps tehn were very suspect, so lotsa people including the captain,
went running to see. The boat was in harbor at the time.

There were potatoes all over teh deck.
There had been an argument whether one could dive off the masthaed,
and they decided to do it scientifically first, and throw the sack of potatoes.

The captain said that would happen to anyone who tried it. He called for the
sailor who thought it up, and was told the man was being fished out of
the water even at that time, because he didn't believe in that scientific stuff.

Bogus, like many other things, is in the mind of the Bogee.
The assay test beats theeeries every time.
Sheesh.

2806. LARGE TRIODE WANTED

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-13 00:00:00 UTC
From: Dennis Huff <dhuff@san.rr.com>
Message-ID: <35096ADD.1168@san.rr.com>
Source record: 85061

Hi 'Brewers,

I am looking for a large glass triode with over 500W plate dissipation (examples are Eimac 750T/TL, 1000T, etc; but I am not looking for 450 TL's). Tube must have at least a good filament.
No, it is not intended as a desk lamp, but for a homebrew rig. These large bottles were never popular for rigs, which is exactly why I want to use one (I enjoy being contrary, and I'd like to put one of these tubes to work). Any help out there?

73,
Don, W6JL
please reply to: W6JL@e-z.net

You can use a wilkinson combiner/divider to combine two of the modules at a time. Therefor; you would have two sets of modules with a wilkinson on the input and output, 2 of these set of 2 combined modules would then be combined using another set of wilkinson combiners/ dividers on the input and output. I would suggest that you start with two modules first, and two wilkinsons one on the input and one on the output, to get a feel as to how they work, once you have 2 of these individual modules running you can then combine these together for the final product. You should be able to build the Wilkinson using lumped coils and capacitors keeping the cost down.

Here in North Central Oklahoma, there isn't much to hear between
160 and 190 KHZ. The Gwen stations chatter all the time, probably some sort
of test/hand-shake routine which, if decrypted would display a clear-text
message saying, "Your tax Dollars are at work here."

There are harmonics from the horizontal sweeps of nearby televisions
and a good deal of unidentifiable trash that appears to be hash from
switching power supplies and or display drivers.

Actually, my antenna is not the best at all for 1756-meter reception.
It is a 58-foot guy wire which has been outfitted with load-bearing
insulators on each end so it is fine for HF and SWL stuff, but probably no
good for 160 KHZ. I think that loops are used quite a bit for these
lower frequencies, but I do get lots of static and GWEN, of course. I have
never heard any of the European broadcast transmitters from here.

This should be a fairly easy band to build stuff for except for
antennas because of the land involved, but the low frequency lets one get
away with lots of things that wouldn't play on higher bands.

2813. Want to build single channel nbfm receiver (147.240 Mhz)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-13 00:00:00 UTC
From: ptcarter@ingr.com
Message-ID: <6ec4p1$mc6$1@nnrp1.dejanews.com>
Source record: 85068
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.scanner,rec.radio.amateur.misc

Hello-
I have a need for a single channel (need to monitor a repeater-147.240 MHZ) and am looking to put together a simple circuit to listen to only that frequency.(note- I am a no-code tech and I have friends who hang out on that repeater). I'm looking for something light (i can put in my pocket or on my belt, with a earphone)and as simple as possible. Has anyone put one together that can tell me the difficulties and the cost. I've been reading the news archives and stumbled on the MC3363 from motorola which seems like the best solution. If you have experience with this IC or if you know of a simpler path to achieve my goal, please let me know.
I read the app notes (AP980) from motorola. Here are my concerns. First off, it said not to breadboard this circuit, but to use copper traces because occllations will occur. My only tools are a soldering iron, a simpson meter, and some Radio Shack PC board. Will this be a problem? I have pretty limited electronic skills and test equipment. Also, the notes say I can flip dip switches and get 256 2-meter frequencies. This is cool, but I only need one. Can I use a crystal instead? Has anyone a shematic that will make this reciever work? Any push in the right direction will be appreciated.

Thanks,

Paul Carter KF4JIR

It gets better, I see. No, you see, the Fourier Transform predicts exactly what happens in a circuit on a frequency chart. You feed in the numbers and the function your circuit performs, and out comes the frequencies that will exist in the output.

I'll sign a non-disclosure agreement and simulate it, for free. We have a deal? Theoretical designs even have a much greater chance of working in a electrical simulator than real life. So I'm giving you the benefit of the doubt.

> MY POINT EXACTLY.

But there is no proof of geet. I don't plan to rehash that again. Just read my previous post.

>

But it wasn't any sort of magic. It was still a carb. A fuel injection system can be programmed to run a car at the very edge, probably alot leaner than your friends carb, but what would be the point? No power equals no use, and thats exactly what you get when running lean.

> One of us needs to think, one of us really do, I swear.

A motor can't run water because it improves gas exit or entry of the engine. There is the energy content factor, that you seem to overlook. What about otto cycle maximum effeciency presented by Gary? Even if you had external pumps sucking the gas from the engine, it couldn't achieve the effeciency noted by GEET engineers. Plus, anything that draws power from exhaust will inherently stall the gas flow more. Even turbos, wonderful devices they are, increase backpressure within the exhaust system. Exhaust tuning is limited to certain engine speeds, but again, it doesn't give a engine liscense to burn water.

> BETTER YET, TRY IT IN A WELDING SHOP.

Well, we are waiting ..... just make sure it fits in a standard mount so it can be hauled off an analyzed in a real test environment environment. Make everyone sign non-disclosure agreements. I am not ridiculing pulse jets, just your design.

> That don't need a Cray. It needs math the Cray ain't got neether, by gar.

I take it you have never seen a modern parallel computer running a modern fluid dynamics procedure. Its pretty dang accurate, actually. Modern engines that run in real life, run in these simulations, and nowadays, simulations are what the real life devices are based on. IF you rewrite the laws of physics after finding your engine works, in real life, then the previous engine designs should also work in the simulation. I think computers have changed alot since you purchased your last.

Email to Bill elicited the response that there's also a "B34" marking on the package, and from the package description, that marking, and where it is in the circuit, it appears almost certainly to be a Motorola MBRS340 Schottky 3A 40V "rectifier" diode (used to provide protection that the "wall wart" input is connected in the right polarity, apparently.) Hopefully the problem is solved. (Seems like the normal practice is to put a marking of 2 or 3 characters, at least one of which is alphabetic, on SMT semiconductor parts too small for a complete part number marking.)

: stability. Thank You.

Possible?? Well, perhaps. But much easier to just buy something designed more for the task... Maybe a "baby monitor"? Probably find a set at a garage sale cheap. Or...if you're intent on building something, there are kits and circuits available for FM transmitters. By the time you converted your FM mic to PLL control, you'd be better off just using a chip designed to do what you want in the first place.

(edited for space)

Paul,

Unless you're determined to build one, why not try to find a used VHF
pager somewhere in that band and recrystal it to the freq you need. A
lot of times, you can pick up a used pager for $15.00 to $20.00, and a
crystal should cost somewhere between $15.00 and $30.00 max.

Good Luck!

Oh dearie me, I presume our Mr. Muldoon made the mistake of thinking you a homophobic bigot. Quite right you're annoyed about it - you were just generally being bigoted, the derogatory reference to people as "fags" seemed to pass you by entirely.

Let's get one thing straight (no pun intended), this is a newsgroup for articles on VALVES. Remember those? Little glowing glass things? Try one of the macho groups if you want to be the all-American dumb bigoted jock, not in this one, matey! If you want to try any more anti-gay remarks, go to a gay newsgroup and try it there. Being torn to shreds by leslie-beans isn't one of the worst ways to go.

With fond regards,

Russ Sadd

PS: Please brush up on your grammar - a little punctuation goes a long way. So does humility - I can't say getting to know you better sounds like a fun thing to me. Was that subtle enough?

Probably a good guess at the GWEN messages :-)

Actually, one of the best LowFER signals in the country is Bill Bowers'
"OK" beacon from Davenport, OK on 189.95 kHz. It may not be on all the
time, but is your best bet at capturing a LowFER signal. Usually
readable here in Minnesota on those rare nights when QRN isn't
excessive.

Believe it or not, the el-cheapo handheld counter from the local Rat Sh*t store sees more use around my bench than my mega-fancy HP5345. This is a great little counter, and it's often on sale for $79.95 or so. If I remember correctly the RS catalog # is 22-305.

These seemed to disappear from the shelves for awhile, but lately I've been seeing new ones appear again. Don't know if they changed the catalog # or not.

I don't remember what the specified upper limit is on the 22-305, but given a strong enough signal, mine works to about 2,500 MHz.

2833. FS Homebrewed 2 meter and 432 tube amps

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-13 00:00:00 UTC
From: "Paul A. Cianciolo" <Paulc@snet.net>
Message-ID: <6ee1i6$j2b@news2.snet.net>
Source record: 85088

Hello Folks,

I have forsale a 2 tube amplifiers. Both run off of a common power supply. Both use a common metering deck. They were part of the WA1UQC estate. I bought them with the intention of getting back on the UHF/VHF bands. Both were operational at the time of dismantling .

I did not fire up the amps a year ago when I got them, and now, I have no time and not as much interest as I did. There is no diagram for either amp or the power supply.

Amp 1
Pair of 4CX250B's
Plumber's delight. I believe this was built by Fred N1DPM. Nicely built amp. Rackmounted
I have a spare set of tubes for this amp. I have not tested the tubes.

AMP 2

Single 4CX350 This looks like it was a commercial amp that has been modified for 432 service.

The power supply weighs about 80 lbs maybe more.

I do not want to ship these units.

Price is $250.00 for all 3 pieces.

At 28 Mhz all you need is a xtal controlled oscillator with additional amplification, if needed. To get to 144 Hhz use a 24 Mhz overtone xtal operating at 3rd harmonic (72 Mhz) and a single stage doubler. A very simple doubler is also a full-wave diode rectifier with input tuned to f and output tuned to f*2. While they are passive, they require few parts and do not consume battery power.

I built several of those George. Each one worked quite well. As a
matter of fact I have one out in the garage that I had on my old VW
bus! (Yep good ole "bong technology" :>) It managed to increase
mileage by a few percent and definitely helped "ping". I have spoken
to some of my hippie friends and they believe (in between bongs hits)
that it "cools the charge" and allows the gas to burn slower. Does
that make sense? Seems that if the humidity is higher gasoline burns
better. Since I live here in Oregon, low humidity is not a problem.

Fascinating, where are they successfully being employed?

I've found that successful inventors generally have large numbers of
products on the market. They aren't paranoid about having an idea stolen
because they seldom have the time to develop them all before the market
niche they fill passes them by. Time to market is the name of the game.
That's why most products are marked "Patent Pending", if anyone bothers
to patent them at all.

OTOH unsuccessful inventor wannabes are almost invariably paranoid.
They think the world is out to steal their ideas. They must be, because
people aren't *buying* their ideas. The unsuccessful inventor never seems
to realize that there's a *reason* why people aren't buying their ideas.

And I have just the spectrum analyzers to gather it, as does any reasonably
equipped radio shop. It is simple enough to prove your claims. You can even

keep your boxes sealed for all I care. All I need is to be able to sample the signal being sent between transmitter and receiver in order to measure its bandwidth. If it is passing full fidelity music in realtime, the bandwidth will be greater than 100 Hz, or the required SNR will be so unreasonably high that it will be of no practical use. Shannon's capacity bound won't be denied.

Shannon's capacity bound is C=B*ln(1+S/N). Transposed to solve for required S/N it is S/N=exp(C/B)-1. Substituting in a bandwidth B of 100 Hz and a required capacity of C=44,000 (Nyquist limit for CD quality music), the required SNR in db is 1911 db. Even if we'll accept speech quality (C=5000) audio, the required SNR for a 100 Hz bandwidth is 434.3 db. That's totally useless, and a far cry from the 19.5 db SNR required for CD quality music in a 10 kHz bandwidth, or the 1.16 db SNR required in a 165 kHz bandwidth. (Of course these are theoretical bests, in practice we can't achieve CD quality with transmission link SNRs that low, and neither can you.)

I expect you've fallen into the same trap that Petit did when he first published his Clover system in 73 Magazine. He claimed a 2 Hz bandwidth. The actual bandwidth is 500 Hz. The problem was his spectrum analyzer didn't catch the sidebands because they were below its noise floor, but not below the noise floor of the Clover receiver in his test setup.

Common spectrum analyzers have a noise floor of -80 dbm to -100 dbm while most receivers have a noise floor of -120 dbm to -140 dbm. So a faulty test setup led him to claim theoretically impossible results. When it was measured more carefully with a signal level that was above the spectrum analyzer noise floor, the truth came out. Clover is good, but it isn't better than theoretically possible good. And neither is anything else, not your music system, and not the GEET processor.

In fact they have to. Rewriting physical law can't negate any previous
observable. If it does, then your rewrite is incorrect. New theories
can't negate any of the observable results of prior theory. When
Einstein's theory displaced Newton's theory, apples still fall from
apple trees.

The Rat Shack counter is excellent. Its best feature is that it is deaf as a
post, so it won't send you off chasing stray signals when you're trying to
do a measurement on the bench. Recomended.

ke4zv@bellsouth.net (Gary Coffman) writes:
>The Rat Shack counter is excellent.

It does have one un-feature that we discovered around here: the timebase oscillator is voltage dependent. If you're running it from an external wall wart, the voltage is regulated by an internal 7805, and it should be stable and accurate. As it happens, a fully-charged set of NiCds also seems to give the same readings, even though the battery voltage is unregulated.

But put in alkalines, particularly ones that aren't so fresh any more, and the reading can be several PPM off, without any warning.

hello Paul
I realise this is not, necessarily, the answer you are looking for,
however, have you considered getting one of those, fairly,
inexpensive, scanners, like those from radio shack, and use it. I
realise this would be more expensive but you would have the
flexibility of what you want plus the ablility to change frequency as
your receiving interests change, eg, a qso on that repeater might
decide to qsy and you would then have the opion, range permiting, to
follow them.
Just a thought.

2862. ExpressPCB PC board layout editor, download for Free

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-14 00:00:00 UTC
From: support@expresspcb.com
Message-ID: <6eds8d$ih6$1@ndnws01.ne.highway1.com>
Source record: 85016

Engineering Express has recently made available ExpressPCB,
a PC board layout editor for Windows95. A fully functional
version can be downloaded at no cost from
http://www.expresspcb.com

Please understand, this is not a hobbyist effort. It has
been developed by a professional programmer, having written
applications for Peter Norton Computing and Symantec. Our
staff also includes an electrical engineer that has a decade
of microprocessor based electronics experience.

Along with the software, Engineering Express has an integrated
PC board fabrication service. Users can layout a two-sided
board with plated-though holes and order it directly from the
ExpressPCB layout editor. The software sends your order over
the Internet to our service. Within 2 - 3 business days, an
overnight courier will deliver your boards. An order for 2
boards typically runs about $95 plus shipping.

Please visit our web site at http://www.expresspcb.com to learn
more about the software and manufacturing service.

First off, your concern/gripe seems poorly founded. The
impropriety you seem to be whining about is at worst an
indescretion hardly worthy of note, and could've been quite
simply a mistake or miscommunication.

Secondly, judging by the ISP, path, newsreader, use of language,
subject content of post, and grouping of usenet groups posted
to (this is not as obscure as you might think- have a look),
"watcher" <wakanisay@owell.com>)
is in fact
"MK" <MKAUDIO@prodigy.net>.

"wow some people will do anything to cut down the competition!"

How true! How much lower will this guy sink? For another example of
how low he's gotten, see his "Why I hate whiny fags" post and ensuing
thread in rec.audio.tubes 1998/03/10. What might the future hold?

Ethan

Watch the part numbers - you're probably looking for
T50-2 and T50-6. FT means ferrite, a different animal,
with different numbers (like FT50-43 and FT50-61)

Dear JM,

Like most people, I don't read the entire contents of newsgroups.

Very recently, because my screen was becoming extremely cluttered
up, I did some spring-cleaning and dumped everything into the
waste bin.

After a nice clean start almost the first subject to appear on
the screen was this one about focal points of dishes. The
original query was not displayed. There was a copy of the
original query in someone else's reply. So, as I had a little
time on my hands, I answered it in an entirely different manner.

Quite a coincidence. What did _you_ say? Are you an amateur
Newtonian Mirror telescope maker too ? In the USA they are known
as TN's (Telescope Nuts).

Yours, Reg.

>http://www.expresspcb.com
>

[snip]

"Stan" omits the fact that the only option after creating a layout is to send it to Engineering Express directly over the 'net (with your credit card number) for them to make the boards. It is not a demo / crippled / time limited version of a proper PCB layout program. You may print the layout but it prints with a grey background to stop homebrewers.

Therefore unless you want to order your PCBs from these guys I wouldn't waste time downloading the 4Mb program file.

If you do, this is what it will cost. From the example layout (5" x 3" DS):

Setup fee: $67
Board cost $20.80 (2 boards - min qty)
US Shipping $7.47 (UK $29.35 + $10 "international handling fee")

Just thought I'd clarify after wasting that bandwidth..

Hello,

if you are interested in experimenting with Highspeed Packet Radio
(9600bd) and want to save money instead of buying a $$$ 9k6 TNC, make
your own cheap&simple modem, developed by Chris - OE5DXL
At this moment there are drivers available for Atari (L2STX), PC DOS
(L2PCX) , PC Windows and LINUX.

(for atari ST the driver L2STX also can be used for 1200bd baycom alike
modems, PC users can use Baycom driver for 1k2 modems)

More info and files/links you can find on my webpage at:

2879. Re: Where to mount a feed in a dish ? (focal point?)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-14 00:00:00 UTC
From: "John M. Franke" <j.m.franke@larc.nasa.gov>
Message-ID: <350AA079.40CA@larc.nasa.gov>
Source record: 85033
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.space,uk.radio.amateur

Assuming the dish is center fed, the dish surface can be described as a prabola.

Y^2 = 4 FX
Let Y = the radius
X = the depth
F = focal distance from the center of the dish to the phase center of the feed.

F = (Y^2)/(4X) = (45 x 45)/(4 x 13.5) = 37.5cm

Focal ratio (needed to design optimum feed) = F/2Y = 37.5/(2 x 45) = 0.42

Hope this helps you

John

> Are you an amateur Newtonian Mirror telescope maker too ?
>
Hi
but I have some connection to a former radiotelescope, the site has been
taken over by some local German microwave amateurs like DK2UO, DG1KBF
and many more. Any radio amateur are invited to be a supporting member
of this microwave society, but I do not have the address available now
(sri) I believe the fee is only 20.-

They need all the support they can achieve because some strong interests
want the field to be taken over for a nearby golf course. So if you
choose microwave for golf it would be a good idea to support this, and
the worst side is that they pour out some poison on the ground to avoid
grass growing too fast, this spreads into the ground water.
It is one 10m dish mounted on a high tower and a smaller 5m diameter
dish on the site. And the place is on one of the tallest points between
K In and Weinheim.
I went there with DK2UO, Hei-Jo last time I was at the Weinheim VHF
meeting.

Re>And wiggle about for maximum smoke.
Re>Does not work for a mesh dish.....

Have you actually TRIED with a mesh dish? It works quite well sometimes.
Presumably the gain of a given mesh dish, at visible frequencies and
infra-red, is around half what it is for 10 GHz.

If you find it difficult to find the focal point with string, either see
alt.fan.goons (obsessed with string they are) or simply use a whitish
postcard.

Have not done it for years, but used to be when you bought a new crystal from one of the major manufacturers, you could order it for the frequency you wanted. Wasn't that expensive.

When grinding your own, you proceed slowly and measure often. It was a real pain to clean the crystal up, dry it off and reassemble in the housing, but thats what you did. The closer the tolerance required, the slower you went and the more iterations. Usually an evenings work would do it.

These tubes were known as Thyratrons and were used as power switches and in sync rectifier circuits. There were small ones and large ones. They were the vacuum tube equivalent to the SCR. At one time they were used with big transmitting tubes for industrial dialectric and induction heating, as well as diathermy machines in medicine.

As a kid, there was a ham down the street who had a rig as big as two refridgerators that used them. When he keyed his rig on 75 M the tubes lit up in a little window in the front of the cabinet and the whole rig buzzed and shook as he modulated. It was as if God was speaking from Zion, complete with frightening blue bolts of lightning!

Think about taking smaller resistors and cooling them in a container of oil. Don't know if Wesson oil would work at those power levels, but used to use it all the time up to about 1 KW with MWF. Resistors were bought and banked from Ohmite. 2.5 Kw could result in a very good design problem!

Some years ago there were several popular circuits that used a germanium crystal detector and an IC AF amp. With a simple antenna these worked fairly well and they were even legal to carry on airplanes.

Another scheme was to use a germanium diode mixer with a local oscillator (FET tuned to F+/-IF) to build a converter that would work into a regular AM BC receiver or FM receiver, depending on what kind of detection you needed.

Simple "rush" boxes (super-regen) detectors are easy to build, but must be very loosely coupled to an antenna and shielded to reduce radiation.

Hello,

Can someone tell me where to put a feed in a dish ?

The dish diameter is 90cm or radius is 45cm.
The depht of the dish is 13.5cm.
The dish is used at 1700MHz.

Who can help me working out these problem ?

!!!! ALL INFORMATION IS WELCOME !!!!

Thanks to all the peopele who write me!!

>Phil G4ZOW

I tell you what, Phil, bring your new Camaro by the shop and we'll
pull the engine and put it on the dyno and do a baseline run to determine
stock brake thermal efficiency. Then go get your GEET processor fitted
and bring it back. We'll pull the engine again and run it on the dyno. If
the brake thermal efficiency is 3 times greater as GEET is claiming,
I'll eat all testing costs. If it isn't, you pay me for all testing costs. And
if you don't trust my testing facility, I can arrange to have it tested at
any of several top NASCAR or NHRA engine builders' facilities instead.

I'm not worried that I'll be eating any testing costs. I'd love to put the
kabosh on these scamsters before they get a chance to bilk more
money out of the gullible public.

I am sure that there are people who can mathematicly come up with an answer for you. I am an engineer, but I wouldn't go at it that way.

I think that you can find the focal point using some very simple tools. First of all, find the exact center of the dish. Take a dowel, broom handle, or thin stick and fasten one end of it to the dish with something (duct tape, screws, etc.) Then using some thin sticks like 1x2s clamp the center stick so that it sticks perfectly straight out of the middle of the dish. You can determine this by making the measurements from any point on the edge of the dish the same distance to the center stick - 45 cm. Then point it right at the sun. Using a small mirror (like women carry in their purses) place it on the surface of the dish and see where the suns reflection hits the center stick. Mark it there. Move the mirror all around over thd dish marking where the sun reflection hits the stick - hopefully all of them will be in about the same place. That should be the focal point. When you rig your lnb or what ever you want to focus on, allow a way to make some slight adjustments. There is another way.

You could also draw thisdish to scale on a big piece of paper and plot the centerline by measuring equally from the ends to several places. Then draw parallel lines to the centerline and measure the angle these lines hit the dish surface. Since the angle of reflection will be the same angle as it glances off of the dish - plot the angle and see where the lines intercept the centerline. Every parallel line's intecept with the dish should reflect right to the focal point.

Let me know if you have any luck with it. Walter

>Does anyone know where I might find one (cheap, naturally).

One source is to get a "Variac", variable autotransformer (that somebody has burnt out the wiper brush on) and use the core. This is a torroid with a built in line voltage winding. You thread the needed number of windings through the center of the core, for about 1 - 2 volts per turn. For this use, you might want a ballast resistor in series with the primary.

Another possible is a microwave oven transformer where you replace the high voltage winding. Microwave oven transformers often have magnetic shunts in the core to act as current limiters.

Archive-name: radio/personal-intro
Revision: 2.2 98/14/05 03:50:23
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul
Schleck, K3FU, pschlect@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
newsgroups is so that folks who aren't interested in, say, homebrewing,
don't have to wade through messages about homebrewing on the way to read
about Field Day. Posting appropriately is just good etiquette.
```

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserve.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

> government takes ham licenses very seriously.

This is true ...

> Be sure and do it right our you could really find yourself in big trouble.

So is this ...

> Also, you have to have a license for the State you are visiting in.
> A Mexican license in one state is not good to use in a different state.

Unless things have changed dramatically in the past couple of years,
this last part is totally false ... SCT (Secretaria de Comunicaciones
y Transportes) is a Federal agency, like our FCC. Licenses are good
throughout all of Mexico and its territorial waters.

Anent moonshine, you might go to the something -- dot -- gov page
for teh ATF people, and see if they have the homemade alky regs
there. Last I heard it was legal up to about 200 gal/year,
IF YOU ARE REGISTERED WITH THE ATF, and meet a lot of rege.

Else, of cuss, you go where my unca Denny went for moonshining.

>I want to connect a frequency counter to a Hammarlund HQ100
>receiver, for accurate tuning readout. Can this be done? How?
>
Yah. It is reasonably easy, too. There's always a catch, of cuss.
Find the output of the Mixer oscillator, and set your Freq meter
to an offset equal to the intermediate freq. That will be the diff
twixt your osc freq and the sig freq. Simple, wot?

Of cuss, if you can't offset your counter, then you may have to fig
it in your head. After a little practice it gets easy.

I am not good at explaining but I hope that is clear enuff.
Good luck.

2906. Acme Elec. Voltage Stabilizer- Questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-15 00:00:00 UTC
From: k3ky@juno.COM
Message-ID: <19980315.074440.11590.14.k3ky@juno.com>
Source record: 84960

Here's a couple of questions for you old-timers in the group, who still remember how to build and troubleshoot tube gear- Hi!
I recently acquired an old Boonton 260A Q-Meter, which I managed to coax back to life. It contains an Acme Electric voltage stabilizer. I believe this is more or less the equivalent of a Sola constant voltage transformer. I have two questions about the Acme unit:
first, is there any likelihood of locating a replacement unit for this one, which has died, and second, did these units contain PCB's?
The one I have would play for a while and then drop way down in output voltage. It would get fairly warm, but still touchable. It eventually vented and released a pretty nasty smell and a small amount of medium-brown oily liquid which I have a strong hunch may be from a failed oil-filled capacitor containing askerels (PCB's.) I got the shop ventilated and moved the few items that got covered outside. I really didn't need to be fooling with this thing, since I have a little 120VA Sola that seems to run the 260A all right anyway.
The Acme unit looks a lot like an oversized ballast for a flourescent light fixture- black, rectangular, about 8 inches long. anyone have an idea where one might be found? This one is a model T-31370 and is rated 50VA. The other ratings are partially missing from the label, but the unit seems to input 95-130V 60 Hz and output 115 V with +/- 1% regulation. It sure would be nice to find a close or exact replacement, so it will fit inside the cabinet like the original. My little Sola is too big and will have to be run outboard.
Oh, yes, I do have a third question: My Sola transformer runs hot as a pistol. You can put your hand on the laminations stack for a while, but it is definitely more than just warm. Might this be normal for these guys? Or might it be the result of loading it too lightly? Any and all comments will be appreciated.

Hi, there was a question some time back about animal location. WE had to solve this and ended up with the following. Single silicon transistor, one 1.5v cell. Coil between base and collecto, direct, ie no dc block. Audio transformer , one winding in collector to supply, other in emmittor to earth. Small capacitor in emmitor as rf short. Transformer makes it give off audio tone so domestic radio can be used for rx. We tried at 250khz and 100MHz. Surprisingly lf worked best. Incidentally, coil direct base collector oscillator great on 1.5v only, overlooked circuit, very good for uhf.

Due to an ordering foul up, I ended up with two of these boards instead of one. I built one and it's a nice little receiver; the other is surplus. It's a nice, compact double-sided board. KANGA gets $10.

BTW, if you're not familiar with this "R" series of DC receivers, the LO isn't on the board; you provide one separately.

$5.00 postpaid.

Cross-posted to: uk.radio.amateur,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I don't know anything about GEET or their
process. In fact, I have never hear the term before.

But, I asked my father about this. He says that
water injection was used in aircraft engines
during World War II to increase effective
power output. He says you can find lots of
old (1930s) articles on water injection
in the Journal of the Society of Automotive Engineers.

Apparently it works by increasing cyclinder
pressures near the bottom of the stroke.

Of course, there is no energy coming from the
water, and the water is not burning, and there
is no violation of the law of conservation of
energy.

In a water injected engine there is less energy
in the exhaust gases, all other things being
equal. The water is merely a means of
extracting a little more useful energy from
combustion gases.

My Dad says further, that water injection
shortens engine life and for ordinary applications
(other than racing or warfare) it is not worth
the trouble. Of course, it is quite possible
that technical advances in the last 50 years
have solved the drawbacks of water
injection.

For cheap, it is hard to beat an old auto battery charger (jumper out the diodes) or a buzzbox welder. A *big* filament transformer will work too, but even used they usually will cost you more than a yard sale 30 amp battery charger.

I don't recomend trying to convert a FM rig to SSB. You'll practically
have to rebuild the whole thing. The PA will be Class C, the IF strip
limits, the Tx multiplies instead of hetrodynes (or directly modulates
the synthesizer VCO), and of course you'll need a SSB generator
and product detector. The LO tunes in *way* too coarse steps to
be useable for SSB too.

The better (cheap) solution is to pick up a yard sale SSB CB and build
a transverter for it. There are some transverter designs available for
homebrew (check out Ian's "The VHF/UHF DX Book" for circuits),
and Down East Microwave, TenTec, and others offer kits. A used
Microwave Modules transverter would also be dandy.

Most of the kit or commercial transverters will assume you're starting
out on 10m. There are two ways to deal with that. The first way is to change
the crystal in the transverter to use a 27 MHz IF instead of a 28 MHz IF. The
second way is to freeband mod the CB so that it will work up on 10m, and also
"slide" between channels to give you the continuous tuning you want for SSB
operation on 6m or 2m. The latter is probably the better way to go. Some CBs
are very easy to mod, some aren't. Check with your local bootlegger to find out
which is which.

Another approach is to get the Kanga kits for Campbell's R2 and T2 and build
a LO for them on 6m or 2m (a VXO will do). These are phasing method receiver
and transmitter kits that'll work from 100 kHz to 500 MHz depending on what LO
you supply. Output is only a few milliwatts, however, so you'll need to build an
amplifier too. This would be the mostly homebrew method of choice.

2920. Pse help w. TRF design & calcs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-15 00:00:00 UTC
From: b.h.jarvis@hw.ac.uk
Message-ID: <6ega2vrbm1@cn1.hw.ac.uk>
Source record: 84974

I'd be grateful for advice about a 1920s style TRF Rx which I'm designing as I go along. Two main questions at this stage:

(1) If I have 2 stages of RF amplification (using 1920s 4 V valves), and I aim to receive a 500 kW station on 198 kHz which is only about 20 miles away, might I end up with TOO MUCH RF voltage at the detector? I suppose that is one reason for the invention of AGC.

In order to use the valves I have for amplification at RF and AF, I had planned an OA81 diode detector but if that, with its forward voltage drop of 0.2 V, "gets" several V of RF, might it not detect very well, and/or create audio distortion?

One of the aims is to show how very good is the audio of AM broadcasts on Long and Medium wave. (I'm old enough not to hear above 9 kHz so I don't need FM!)

Question (2): I'd like to make large-diameter tuning coils like those in 1920s books and magazines. Please help with the number of turns - diameter typically 2 inches. (OK, they didn't use yogurt pots but I can only go so far. THEY didn't have conical coils which can slide in and out!)

The tuning C is 50 to 1000 pF (actually a 2-gang 500 pF.) I would really like to be able to cover 198 kHz (BBC Radio 4) to 900 kHz (just above BBC Radio Scotland) but my preliminary calculations using 50 to 1000 pF semm to suggest this can't be done and I will need a tapped coil. Which surprises me and I think my slide rule might need new batteries.

Many thanks for time, bandwidth, and interest -

AGREED !
However, if the math that is in the new model wasn't in the previous model,
then while the older examples fit the new model, the newer examples may
not fit the old one. In either case, the modelers may no know what questions
to ask the lightspeed computer.

Philoprogentivinisticism may cause the doting mother to ignore her baby's
faults, but the world at large will not do so.

However, the world at large will quite readily throw out the bby with the bath
water.

I looked at the GEET (www.geet.com) page, and I noticed there wasn't any
way to check the "letters of recommendation" until I came to NASA.
I still haven't found an E-mail for NASA, but I got their snailmail address.

I will, if I don't forget, write them and ask if they can find a copy of a
letter written from the source in the page.

Look it up and try it yourself.

There is the essence of avoiding naysaying: Individual, independent investigation to find the truth.

Good luck

ok I might be in the wrong NG, if I am please send me in the right direction, please.

I have an old am-fm stereo receiver (lafayette solid state LR-775) one of the channels is shot, I think it is in the balance/volume knob. What I am looking for is the schematics for this Stereo, Yeah it would be easier to buy a new one, but this one sounds good, on one channel though. Any help????
Thanks
John

>lightly? Any and all comments will be appreciated.

It's normal for these things to run hot. Apparently they dissipate
about 15-20% of the rated output power as heat when there is no load
connected. Run them a full output and the internal dissipation drops
some, but then you have extra heat from losses due to the load current.
Either way, they are hot.

But they're designed to handle the heat, with high-temperature
insulating materials.

It is certainly possible, but then it is easier to add some
attenuation than to add more gain.

>In order to use the valves I have for amplification at RF and AF, I had
>planned an OA81 diode detector but if that, with its forward voltage
>drop of 0.2 V, "gets" several V of RF, might it not detect very well,
>and/or create audio distortion?

The forward drop of the detector has little relation to the tolerable
maximum signal level . The higher the ratio of signal to forward
drop, the LESS distortion you will have. Distortion will occur whtn
the stage driving the detector runs out of headroom, not at some limit
of the detector. This is the reason that a little DC bias is/was added
to the detector diode....the idea was to reduce the forward drop to
zero for the incoming RF. In fact it may well be worth starting out
with just a tuned tank on the antenna, and your detector set up with
an adjustable bias. Essentially a souped-up crystal set. That is a
minimalist approach that will further the aim below:

>One of the aims is to show how very good is the audio of AM broadcasts on
>Long and Medium wave. (I'm old enough not to hear above 9 kHz so I don't
>need FM!)

You should be able to pull in a 1/2 MW station at 20 miles with just a
crystal set. (which give excellent audio quality, by the way) Add RF
amplification stages one at a time to extend your range. In this way
you start with something that works and is fun and build on
it...trying the whole thing in one shot may result in more frustration
than fun.

>Question (2): I'd like to make large-diameter tuning coils like those in
>1920s books and magazines. Please help with the number of turns -
>diameter typically 2 inches. (OK, they didn't use yogurt pots but I can
>only go so far. THEY didn't have conical coils which can slide in and
>out!)

The inductance is proportional to the cross sectional _area_ of the
coils, not the diameter, so if using a tapered form and taking only
the average diameter into account, you will come out above the desired
inductance. If you instead use the square root of the average of the

square of the end diameters (whew, say this in one breath!) as the
"nominal" diameter then you will be much closer. From ARRL handbook,
the imperical formula for inductance is:

L= (d**2 * n**2) /(18 *d + 40 * h)

Where L is in microhenrys,

d is diameter in inches,

h is length in inches (book used l, but that looks like 1 or I here
and might confuse)

n is number of turns

* means multiplyed by
and ** means raised to power of... so **2 means "squared"

The book cautions that coils need to be at least 0.4 d long for the
formula to work well.
I've applied this formula in several projects and found it to yeild
coils _very_ close to what I was aiming for.

When using your tapered form, d will vary with h which varys with n
which will cause a lot of trial and error. Might I suggest you use
short sections of plastic pipe, or shellac saturated toilet paper
tubing...at least that leaves only h varying with n. I prefer the
paper forms, as I can then shellac or varnish without fear of form
melting in whatever solvent is used in the coating.

>The tuning C is 50 to 1000 pF (actually a 2-gang 500 pF.) I would really

>BBC Radio Scotland) but my preliminary calculations using 50 to 1000 pF
>semm to suggest this can't be done and I will need a tapped coil. Which
>surprises me and I think my slide rule might need new batteries.

Nope, your cells are fine. The frequency ratio will be limited to the
square root of the capacitance max/min ratio. This is ONE of the
advantages of a superhet. The LO operates at 455 (or whatever) higher
frequency, so the ratio of min to max frequency is lower for a given
span. The cap will only cover a 4.47:1 range at best, (if you can
keep circuit stray C to zero) and you are wanting to cover a 4.54:1
range so you've come up just short. (Murphy is laughing at you!) It
might be easier to switch in a small capacitor in paralell with tuning
cap to cover the low end, than shorting coil turns to catch the high
end.

Yeah, that is the right catalogue number... I got a brand new one last
year in a local hamfest. It was on sale in the RadioShack stand for
$29.95. It works great and measures the 930 MHz PLL I built fine. I
think its spec boastes 1.3 GHz upper limit.

Many valves for UHF and SHF transmitters in stock. 2C39, 2C42, 2C43
and 2C46. 2C39 has a 100 Watt plate dissipation and is usable up to
about 3GHz. 2C40 - 2C46 is so called lighthouse triodes.

5675, 5876 and 6263 is pencil valves for frequencies up to 1,7 GHz or
more.
416B must be the ultimate UHF valve. Usable up to 4.2 GHz

EC 157 is a very rare Mullard lighthouse triode. 12.5 Watt dissipation
S=21mA/V u=43. 1.8 Watt output at 4GHz 8dB gain

E810F wide band pentode S= 50mA/V
Klystrons, magnetrons, travelling-wave tubes, UHF and SHF rectifiers

Visit my homepage to have a look.

>plug (and pins) alone??

The =real= item, locking tabs, six pins and all, can be purchased from the
ICOM parts department for a little over $2. For example, the ICOM part
numbers are:

Part #93606287 LLP-06 HF Cord End @ $1.2169 each
Part #93602726 Pin LLF61T-2.0 Female @ $0.1432 each (6 needed per plug)

A phone call to (425) 454-7619 will get you as many as you like (The above
prices are based on the dozen sets I ordered.) You can use your credit
card and for about $3-4 get First Class Mail delivery.

Hello,

Thanks for reading our "Press Release". We are excited to
announce the Release of "The Original Southern California Repeater
Location Guide". This exciting and most up to date guide available is
now on the Net. With the most complete listings of all Open and Closed
repeaters for 2-meters, 220 MHz, 440 MHz, 1.2 GHz, 6 & 10 Meters in
Southern California, you will see why this guide is one of the most
sought after directory available. Find out more at...

I have the following equipment that needs TLC to put it back into
working condition.

B&W 334 Dummy load/wattmeter- same as a Waters 334- three scales
measuring 10-100-1000 watts. Meter is not reading, meter seems to be
ok, some problem between the rf pickup in the dummy load and the
meter.............$35

Icom IC-27 2 meter transceiver, synthesized model....dead $50

VHF Engineering 160 watt 2 mter brick amplifier.....bad relay $50

From: dcowey@cyberia.com
Message-ID: <6ehtfl$26n$1@news3.microserve.net>
Source record: 84902

I am posting this question here because we have many techs among us,
and one of you may have seen this problem.

AST powerexec 4/33 sl colorplus. If the unit is tilted on its
front edge (with power off) it will not boot up when switched on.
If you first tilt it to its back edge (with power off) then open it
up and switch it on, it will nearly always boot o.k. I have checked
all normal service proceedures, and suspect a broken surface mount
device. Anyone ever worked on this problem?

TNX in advance, Don (guï¿½mundur) KD3SH

Cable decoders? What does that hace to do with amateur radio? We
connect our antennas to our radios with cable 50 ohm and sometimes
ladder line and some times 75 ohm, never had to decode a cable. Now
we have software and hardware to decode morris code and digital packets.
But nope don't know why we would need to decode a cable maby you mean
is there a device out there to tell the impedence of a cable. Yep, there
is called an impedence bridge. But most cable has the info marked right
on it no need to decode. Look on the cable to see if there is the imp
or even a part number. part numbers can be looked up in books or probly
the internet. give some indication of the markings on the cable I bet ya
some HAM out here can tell you all about it.

John, why not open it up and even pull out the control and look at it? A lot of them have the value stamped on them. You should be able to find a match at an electronics parts store. It may be a piggy-backed double potentiometer that is common. I have an old Realistic amp like that. It stillworks fine. Good Luck. Walter

Building SSB equipment that is stable and practical is not as easy as it may seem. There was a day when we played around with SSB transmitters and I built a phasing exciter. It was for a set frequency and it had to be mixed to the desired frequency above or below the main frequency. You can't just triple and double SSB up to VHF and UHF as casually as you can other modes.
You can make a transverter to mix a HF SSB signal, but I suspect that you will not everbe on par with a commercial rig. Good Luck.

Thanks for the reply.

Sorry about breaking up the thread. I accidentally deleted the message before replying.

Anyway, a fellow emailed me that he had bought some similar transformers some years ago for the same purpose. He offered to sell me one for $40. They are 6V-75A units.

I have been poking around on the internet and not found much of anything.

I'm not sure what I should do at this point.

: >
: Yah. It is reasonably easy, too. There's always a catch, of cuss.
: Find the output of the Mixer oscillator, and set your Freq meter
: to an offset equal to the intermediate freq. That will be the diff
: twixt your osc freq and the sig freq. Simple, wot?

Yes, if you use a standard freq counter, and measure the VFO freq
it will be different than the receive freq by whatever the first
active IF freq is. It will be lower or higher depending on which
side the VFO is tuned to. On a set like the HQ-180, the counter
would read 455 kHz high on bands below 7 MHz and 3.035 MHz on
bands above, if I remember the freqs correctly without running
to the manual.

A more convient choice is to get a digital display counter
from a company such as AADE (www.aade.com) Some models of
digital display measure only the VFO freq - others measure
all the different oscillators involved, VFO, conversion oscillator
from frist to second IF, BFO is SSB, etc. This gives a more
accurate reading, but requires more connections to the receiver.

A couple of thoughts...once you have tried ssb you'll want an all mode rig. It is possible to buy an old HF rig pretty cheap and buy transverters for it that wil give you adequate performance. An an example, I bought an hf rig for 75.00 at a swap meet. didn't work on 40 and 80 anymore (never could figure that out) but was fine on 20 and 10. I bought a ten tec 6 meter (second hand, but unbuilt) and 2 meter transverter (new) that I had to build. Picked up a used 2 meter ssb amplifier. Total cost was roughly $400. Antennas, which I still use are made from soldered copper plumbing pipe. Liked operating ssb so well I ended up buying an icom 706 mkII...

Didn't know G.E. made the Syntor...thought that came from Motorola..
The model number looks more like a G.E. Delta, and the description
of the Control head fits a Delta radio as well.....

Paralleling in extra fixed capacitance at the bottom end is definitely
the better idea. You also want to keep an eye on Q at each end of the
range. With a TRF, you need enough Q to reject adjacent channel
signals, but you don't want so much Q that you cut the sidebands of
the desired station. Using a smaller value of inductance and larger
capacitance will help give you enough Q on the high end. Just don't
take this so far that the Q becomes too great on the low end.

Help,
I have a NW 40 radio which I build from a Kit supplied by dans small parts. It works pretty good and supplies a full 5+ watts into my single ened
zep. I have the zep tuned well with a antenna tunner from MFJ(It cost more than the rig.)

Here the problem, the stations for distant Dx's seem to fade. Is this normal? Do I have a stability problem in my VFO? Would a DSP assist in separating
stations that appear on top of each other?

Thanks

Chip

If you're running Windoze, Microsoft has a DTK for sound cards on their website. And if you're using Linux, there is sound card specific stuff included with most of the current distributions. As to DSP code for the SB, I'd like to hear of sources for that too. I've been trying to translate ADSP2181 assembly routines to C for use with the SB. Having working libraries would be so much easier.

From what I could tell, it changed one or more of the intermediate
frequencies. At home, I think I have recorded the likely shifts
from the displayed frequency to the actual freqency.

hy>You should be able to pull in a 1/2 MW station at 20 miles with
hy>just a crystal set. (which give excellent audio quality, by the
hy>way) Add RF amplification stages one at a time to extend your range.

Agreed; and it will enable me to get the first tuning coil (and hence
the 2nd if needed) right.

I don't know whether anyone else has noticed this - how many other
people habitually listen on 1515 metres at about 1 am? - but there is an
audible change in "fidelity" when BBC Radio 4 changes to World Service
on the same frequency. (And back again at 0550 I daresay but I usually
get to sleep before then!)

Furthermore, this change in "fi" isn't evident on anything OTHER than my
crystal set - which incidentally also receives, very well, some strongly
50 Hz modulated hash from I'm told a neighbouring Gas Supply
installation.

hy>In this way you start with something that works and is fun and
hy>build on it...trying the whole thing in one shot may result in more
hy>frustration than fun.

Yes, already made that mistake. Now, when I remove the first RF stage
to concentrate on the detector stage, the carefully calculated
dropping/smoothing/decoupling resistor becomes too small! Yes, I know
there are several things I can do about it. Shorting the 1st RF grid to
deck with a short flex and croc clips was one. I never realised those
old valves could oscillate around 400 MHz until then!

Now, if I'd TRIED to make a 400 MHz oscillator, I'd be finding it
impossible.

hy>From ARRL handbook, the imperical formula for inductance is:
hy>L= (d**2 * n**2) /(18 *d + 40 * h)
hy>Where L is in microhenrys,
hy>d is diameter in inches,
hy>h is length in inches (book used l, but that looks like 1 or I here
hy>and might confuse)
hy>n is number of turns
hy>* means multiplyed by
hy>and ** means raised to power of... so **2 means "squared"
hy>The book cautions that coils need to be at least 0.4 d long for the
hy>formula to work well.

That's fine. All understood. (I use n^2 for n squared.)

hy>When using your tapered form, d will vary with h which varys with n
hy>which will cause a lot of trial and error. Might I suggest you use
hy>short sections of plastic pipe, or shellac saturated toilet paper
hy>tubing...at least that leaves only h varying with n. I prefer the
hy>paper forms, as I can then shellac or varnish without fear of form
hy>melting in whatever solvent is used in the coating.

I like that! My first tuning coil was on a lavatory paper roll inside
(as we called it in those days) and it got The Inkspots and Gert and
Daisy just fine. I shall raid the bathroom, for old time's sake.

It might be easier to
hy>switch in a small capacitor in paralell with tuning cap to cover
hy>the low end, than shorting coil turns to catch the high end.

Now why didn't think of that? (After 50+ years of failing to see
wood for trees?)

Many thanks; also to 3 others who had similar welcome suggestions; and
one who said I should be prosecuted for publishing dangerous recipes.

There was an article in QST (early '70s?) that described a method where the crystal being ground was held down by means of a square piece of brass which was in turn moved about via a center punch inserted in a small dimple in the brass. I'm sure he claimed he moved an 8 MHz crystal to 12 MHz!

QST September 1969, page 26. "Grinding Techniques for Grinding
Surplus Crystals" by John S. Rosenbery

No, I didn't remember this article. I just happened to be looking through some back issues yesterday, and because of this thread, I glanced at the article in case there was something new to add. I noticed the part about the author saying he'd moved a crystal from 8 to 12MHz, so I know it's the same article.

I guess I'll actually have to read the article. The quick glance gave no indication that this was any different from all the other articles about crystal grinding that used to appear.

Duuuuuude, like, their logic was, like, flawless and.... Uh.... Heh heh.
Got any triscuits?

Actually I am pretty sure that the water vapor introduced to the mix had
very little to do with cooling the charge. Some sort of heat exchanger
would be needed to get any kind of useful cooling. What the water does in
the "bongload depingifyer" is to prevent _detonation_. The agua will
indeed slow the burn and prevent power-robbing explosions (ping). A
smooth burn is a good burn when pushing a piston.

I am pretty sure that the army used this method during "the big one" to
allow use of less-than-great gas in airplane engines.

Sure is easier for me to get my head around a water injector than a
computer-controlled ingition! (`course now that the auto guys have the
bugs worked out of them they are prolly less trouble than keeping a
little water tank filled!)

> that make sense? Seems that if the humidity is higher gasoline burns

You don't get any energy from the water. The water is used to slow the combustion speed to allow for extra advance in the ignition timing without causing pre-ignition (i.e. knocking) or to kill knocking when lesser quality fuel is used. Water is also used in jet engines to increase the mass of the thrust air after the combustion chamber, mostly limited to take-offs and landings due to the extra weight.

Well, I guess you may be right. Practical experiments isn't always in
agreement with official technical data on valves. In the magazine
VHF Communications Vol 4, 3, August 1972 page 144-157 is an article
about 2C39 at 432MHz. According to the technical data given here, the
valve needs a volume of 350 l/min of air for adequate cooling at a
dissipation of 100 Watt.

I made a double lattice filter using surplus ft241 6.525Mhz rocks about
25 years ago using Ammonium Bifluoride that I got from a chemist friend.
I have no idea as to its "real" danger. We were young an innocent in
those days!! I used a BC221 sig genny and Telequipment scope. I used it
for transverting (eventually) up on 2m. Obviously etching increases the
frequency and I could just lower them a bit by gently rubbing a pencil
lead on the quartz but the activity (Q) soon reduced. The carrier Xtal
for the filter from what I recall was unceremoniously placed 600Hz into
the passband of the highest series frequency of the filter. Ah rough-n-
ready days indeed but learned a lot.

Thanks to Dick's guidance, I've ordered the necessary connector and pins
directly from ICOM. His part numbers and prices check out fine.

If anyone is interested in the mating, panel-mounted power connector and
pins, following are the ICOM part numbers, as I learned from ICOM today:

93602666 LLR-06 connector

93602725 male pins for the above (6 required)

This is specifically the socket for the ICOM-706 Mk II, but it might well
fit other makes and models, also.

Thanks everyone for their help.

Anybody tried attacking DDS phase-truncation spurs by cascading two or
more synths? i.e., set up the first DDS to generate a clock frequency
which, when used to drive the second and final DDS, will minimize the
periodic phase error due to accumulator rollover?

^^^^^^^^^^^^^^^^^^

You sir, may be the answer to my prayers! I just today picked up a Telequipment S54! (I figured for $65.00 I should just go ahead!) I have no idea how to use it yet. I have been spending the afternoon going around the house and touching it to the bread machine, dimmer switches and the microwave oven. Fuuuuuuuunnn! Do you have a manual for this scope or one like it? Mine goes from 2S to .02uS and has an hf button beneath TV frame and TV line buttons. I am truly clueless, so if you could point me to a good book on using a scope for RF fun I would be in ecstacy!

Sounds like a blast. I have yet to get to a ham fest and find some old Xtal holders...

Doesn't scraping around on the rocks increase harmonics?

Have you looked into either those el-cheapo arc welders that some places sell in the back of Popular Science, or maybe modifying a car battery charger? Sometimes these will cost less than buying a transformer from an electronics store, and if you get one that is wound so it acts as it's own current limiter (like a fluorencent light ballast), it would be less likely to try to melt itself if you short it.

Greetings to the group.
I would like to find plans to build a homebrew 10-80 or 10-160 VFO
using tubes . I am new to amateur homebrewing but do have some
background in electronics as an aircraft mechanic. Would think something
in the begginer/intermediate level. Appreciate any help or suggestions.

Yep, low phase noise allright, Spurious (Plenty of it) only 55 -60 dB down, but low phase noise.

I'm still looking for an inexpensive source of 5.25" and 8.75" rack panels (19" wide)... could even be slightly used with a hole or two if not too bad...

Also need enclosures:
One in the 4 x 4 x 16" to 5 x 15 x 17" range...
One in the 6 x 7 x 10" to 8 x 15 x 17" range...

And a transformer, 16 to 20v @ 20+ amps, 115v primary.

Anybody have any of this? Please Email me.

Well Im interested. I'm just about to errect a 4m mesh dish which is
presently shiny. As I live on the coast, (corrosion) and hope to
camoflage it from the neighbors somewhat, I was considering having it
painted with epoxy green paint in a local paint shop.

Has anyone numbers on loss of efficiency - as its a C Band antenna
and Im wanting to use it on Kband - I guess Im down to 35% efficent
without the paint -

> of all the dyno tests in my file.

So what? Water injection does this already. Are you saying I should by a expensive GEET fuel processor instead. I want neither. As sensors, fuel vaporization at injector, and software improve machine control systems, 99% of what is now achievable by a troublesome water injection system will be attainable. I'm not going to coninuously add water to my engine's fuel system, nor will I mix special fuels for the GEET. Noticeable decreases in emissions and small increases in performance are not what I would call "ground breaking technology" as its played up in the GEET pages. BTW, I have visited every single page you have posted here, but each one has the tale-tale sign of uninformed writers who are soon to be hit for a buck for absolutely no return.

Granted I may still want a water injection system on a prop plane. No matter how reliable an electronic IC may be, they don't hold up well to atmospheric lightening, unless you are the military and can afford the necessary protection.

Not really, this whole thread is a rehash of what others and I have said about water injection. MHD is the moving via application of magnetic fields, or the generation of power by applying a magnetic field to a high energy plasma, of which car exhaust doesn't really apply to. I would doubt MHD would have little bearing on a combustion engine.

Ya'll can spawn as many threads about ICE's in a radio group as you like, but even one of the prime supporters has admitted that GEET is nothing more than a glorified water injection system with only small gains in gas mileage and emissions, both the exact same effects as water injection. Face it people, its not anything special. But you can have your fun I guess, it is a free country after all.

You know, it's all coming back to me now- this is the CORRECT reason
for using water injection- it eliminates detonation and ping.

Thanks for the history lesson! And yes, with it, you can burn a lower
octane of gasoline. The slower the gas burns, the less pinging. And-
some people are not aware of it, but the higher the octane of gas, the
slower it burns.

Just how do you think hydrogen comes about? By alot more energy than you get by burning it with oxygen, thats for sure. Its the common rule of effeciency, and this process happens to be on the best examples. However, we do have plenty of sunlight with which to separate water into its constituent parts, so I would still deem it a viable technology, that is to burn hydrogen (not water, Phil, but hydrogen, I hope you realize they are different) extracted from water at huge solar stations.

It has QUITE A BIT!!!!! You mist it to reduce the surface area of the droplets allowing the water to heat and vaporize quickly. The reduces Charge Air Temperature, by vaporization of said water, which reduces temprature, which reduces detonation. Detonation is when the flame front doesn't start at the plug, but at the cylinder walls, because the mixture is so hot, all it needs is that extra juice available from the cylinder walls to trigger off center flame fronts early on before the plug EVER fires.

So yes, it prevents detonation, but BY COOLING THE CHARGE!!! Nothing less .... its an equivalent to the intercooler used on turbosystems. Heck you could replace the intercooler on a turbo system, but you don't have to fill up a turbo's intercooler with water over and over. If you want the proof in the pudding, write Lotus. They built the most powerful 4 cylinder production car ever made. It took the intercooler a step further with water, but removed the water from the air system and recirculated it instead of air to cool the charge air. The result? 285HP was the last remembered specific output for the engine as I can recall, all from 2.2Ls. What more do you need?

And when you run with less detonation in a engine, that means you can push the timing agressively up towards TDC, making more use of the resulting explosion. Get a basic mechanics text book on engine folks, all this has been written and rehashed millions of times, literally.

At first I didn't mind these threads, but it looks like 80% of the participants wouldn't know a engine from a electric motor.

>Tim,KC7QOM

Let me offer a suggestion, Tim. You don't even want to think about
building an analog VFO with that span. You won't be able to make
it stable, and you won't be able to bandspread it so that it will be
useful.

What you want to do is make a VFO covering a much narrower
frequency range, typically a span of 500 kHz, and then hetrodyne
it to cover the HF bands. A common choice is to make a VFO that
tunes 5.0 to 5.5 MHz. That can be used with a 9 MHz IF on both
75m and 20m directly by using high side or low side injection.
To cover the other bands, you add a crystal oscillator and mixer
to hetrodyne the VFO to the appropriate frequencies.

This circuit was so common in the tube days that you can find
it in virtually any of the older Handbooks.

Bert,

I've used water injection quite a bit over the past 15 years and have no
complaints. If the engine is optimized to use the extra "octane" equivelance
you can see substantial gains. I've seen no problems with engine life. In
fact is seems much cleaner inside. No carbon buildup etc.

One should understand that there are many different configurations of water injection. The simplest just draw vapor under vac from a canister.
The best I've seen is the Goodman system. He actually made it on television and in a few magazines several years ago. He modified his car with pistons that raised his compression ratio to about 13:1, and with only the pistons and his water injection increased mileage by 50%. His system used the air pump to draw the water and provided a very nice "fog" that was proportional to load of the engine, something no other unit I've seen does.

Also, of possible interest:
Have you seen anything on Rudolph Gunnermans A-21 fuel?
It is half water and half naptha gas. It works in diesel or gas engines.

I also recently tested a fuel treatment that promotes the fact that it has water in it. (In reality almost all of them do, though most don't promote it as a benefit. It is also in gas at the pump) . It has worked quite well in most of the vehicles that I've tried it in.

The truth is out there......

A lot of the top VHF operators around here use a transverter and HF rig
rather than a ready-made VHF SSB transceiver. They say that the
overall performance (especially on receive) is better.

> fronts early on before the plug EVER fires.

Actually, that's a form of pre-ignition, a different animal/different cause, with the same result as detonation. Detonation stemming from early timing/low octane/too high compression/lean mixture, or a combination thereof, occurs thus: The flame is started by the spark plug and the mixture begins to burn. As it does, the resulting expansion of hot gasses is compressing the remaining mixture in the cylinder, as is the rising piston. Under the right conditions, the unburned mixture auto-ignites and begins a new flame front. The inevitable collision of the two flame fronts produces the characteristic knock of detonation and the attendant equipment damage that results. Pre-ignition can occur in the absence of a spark. Remember the anti-diesel solenoids they used to put on carbs? You know why they were there; right?

<more snip of some accurate info>

> And when you run with less detonation in a engine, that means you can push the
> timing agressively up towards TDC, making more use of the resulting explosion.

No, and yes. We push the timing away from TDC, as in more advance, as in before TDC. And we aren't making use of an explosion, at least not in a gasoline engine. The air/fuel mixture burns (hopefully), as rapidly as we can make it. More advance, to a point and short of detonation, means more of the induced air/fuel mixture is burned, which obviously means more efficiency and more power produced as we approach that magical .5 lb fuel per horsepower per hour figure. The optimum advance figure varies, based on the many characteristics of the engine that determine the _time_ required to achieve complete combustion. Obviously, advancing the ignition timing beyond that optimum point begins to reduce horsepower output, even if detonation isn't occurring. The goal isn't to run with less detonation, it is to run with _no_ detonation. Detonation always reduces power production.

BTW, if it's using explosions it's most likely a diesel-they detonate by design... And yes, I know you knew it was advance, but that's not what you said. Which leads to my final point.

> Get a basic mechanics text book on engine folks, all this has been written and

If you're gonna crawl in the pulpit, it's a good idea to have all your facts straight. And FWIW, I've been teaching folks for many years now, and I've never found it productive to tell them how stupid they are. There is a profound difference between teaching and tooting.

To those who wonder what this has to do with amateur radio, me too. My apologies if you are offended.

Hopefully, there is no one left reading this thread that still thinks detonation is "valve rattle" :-)

If you keep your rcvr on while you're grinding, you can track
how close the xtal is to the desired freq'y - listen for a
scratching noise in the rcvr - the closer the rock gets to
your freq'y, the louder the scratching becomes.

Anyone have any suggestions for what I should do with a dozen Signal
Corps xtals parked on 7600 kc?

Hello All
The designations run something as follows:

the "50" indicates the OD of the torroid in hundereds of an inch. In
this case 1/2inch OD. The "-2" or "-6" part indicates the "mix" of the
basic Iron powder. For -2 mix (Red colour) it is Carbonyl E with uo =
10 and a typical freq range .25 - 10Mhz. For the -6 mix it is Carbonyl
SF uo = 8.5 and Freq. range = 2 - 30Mhz.
BTW a nice addition to the Homebrew shack bookshelf is the late great
Doug DeMaw's book : "Ferromagnetic Core Design & Application Handbook"
ISBN 0-13-314088-1
~~~~~~

Here in the UK you use to be able to buy them from Howarth, GW3TMP as
well as Ambit International, Essex but I am sure both those sources over
here have "folded" :-(
~~~~~~

Good luck
... Ken

I know the 5345 uses the 10544A -- not sure how this compares to the
10811, but its stability is still impressive. I believe the 5345 is
still in the current catalog, but it can also be found on the surplus
market for a few hundred bucks. I think I paid around $500 for mine
about 4 years ago, including the 10590A adapter that allows it to use
5245-series plugins, and a 12 GHz plugin.

Don't know about the 5245, it's a much cheaper counter so might not have
been built with the high-$$$ timebase module.

Unless I'm missing something, this isn't really a complicated program.
In the old days, there were occasional articles about figuring out where
spurs will show up, and it would include an equation. It was slightly
complicated, but the real problem was that you had to repeatedly use the
formula with lots of different frequencies plugged in. Not such a fun
activity back in the days before even simple calculators.

When home computers came on the market, articles did start showing up
that showed programs that automated this process. I'd start by looking
through ham magazines starting about 1978 or so.

Fifty dollars does seem like quite a bit for a program to do this, which
makes me wonder if I'm missing something. But the simplicity of such a
program does not justify an illegal copy of a commercial program.

>owens@atd.ucar.edu

No, there is no other HP oscillator newer than the 10811 besides
the E1938A, and the E1938A is not an option in any of our
counters anyway. The 10811 has been made for about 20 years
with virtually no design changes. Since the aging of crystals
improves with age, an old 10811 is actually better than a new
10811. Most HP counters had a 10811 option available, but that
doesn't mean it would be easy to add a 10811 to a counter that
did not come with one to begin with, although it might be
possible depending on the details of the particular counter. It
is also worthwhile to note that the 10811 is plug compatible with
its predecessor, the 10544. So if you get a real old counter
with a 10544, you can upgrade it to 10811 by just plugging one
in. If you want better accuracy than a 10811, you need to
buy one of our GPS timing receivers. That will give you orders
of magnitude more accuracy. You would plug the GPS into the
external reference on the counter.

It is also important to keep in mind that the choice of counter
is also a consideration in accuracy. A 53132 can measure 10 MHz
to within 10 microHz in 1 second (12 digits) when using a
suitable external reference such as our 5071 cesium standard.
A simple non-interpolating counter would take over a day to
make that measurement even with a perfect reference.

Finally, if you do get an oven oscillator, be sure to keep the
counter plugged in all the time so the oven never goes down.

>10811, but its stability is still impressive. I believe the 5345 is

The big difference between the 10544 and 10811 is the change from
AT cut to SC cut crystal. Also, the oven in the 10811 is a lot
better. The result is that the 10811 has much less turn on drift
immediately after warm up; not a consideration if you keep your
counter pluggin in all the time and don't have to move it around.
The 10811 also has much better tempco and phase noise. Also not
necessarily super important for a ham counter.

>still in the current catalog, but it can also be found on the surplus
>market for a few hundred bucks. I think I paid around $500 for mine
>about 4 years ago, including the 10590A adapter that allows it to use
>5245-series plugins, and a 12 GHz plugin.

The 5345 was a really great counter. It has an internal 500 MHz
clock locked to the 10 MHz. This allows it to make better
measurements in some cases than a lot of our newer counters.
It's main disadvantage was high cost (for the original
purchasers:-)

Is that 8 ft radius?

Even if it's 8 ft diameter, I think it would give admirable gain on 70 cm, and get you off to a good start with any of the AMSATs.

Thanks to someone kindly mentioning it on this group, I have been extracting and keeping the rechargeable 6 V lead-acid batteries I used to throw away with every Polaroid film.

I've taped 2 of them in series to the back of my IC32E and one charge seems to run it on high power for hours. Much longer than nicads, anyway.

I recharge them by connecting to the car cigar lighter through a 6V5, 0A3 torch bulb which acts as regulator, indicator, and fuse. I don't suppose the cigar lighter voltage could exceed that of a charged 12 V lead acid battery anyway, so not worried about applying said voltage to the Polarpulse batteries.

(Maybe the Polarpulse batteries help start the engine sometimes?)

>for the filter from wha
You applied the very latest Xtal technoques!
Crystal manufacturers increase freq a long way by grinding and listen to
the noise on a receiver as stated. They teen evaporate metal to bring
down 4000ppm. When they want to clean up the rough surface they may give
it a little dip in Ammonium biflouride(is dangerous that little black
hole in your skin hides a big area of damage inside)
The latest high frequency fundementals move fundemental crystals at
30MHz or so to 60 and above by chemical etch . Problem is that cheap
quartz starts to look like gruere cheese. Special quartz or old natural
as you would find in bakalite holders is necessary.

What is a blinker? I mean, there are the types that actually interrupt current flow for the purpose of flashing a lamp, and is even used as slang for turn signal in America, but what does it mean in the UK? At first I thought it was what people here called blinders (of the horses type, but for humans, usually used to mean "a block to reason"), but you have used it over and over, so now I have a curiousity as to what is meant.

If "a block to reason" is what is meant, you have your own "blinkers" on this subject.

Sincerely,

Pearce - KF4MOK

How does your exhaust system hold up? Also, I think the main drawback of
a water injected system is head gasket removal (a way of saying cylinder
overpressure) and valve erosion, but I have never played with it.

> One should understand that there are many different configurations of water

And the gains would be so, if there was probably a roughly 30% reduction
in horsepower. Perhaps Gary could calculate the exact amount, since he
has the formulas and test apparatus. Not to mention this thing really
must have been heck on head gaskets. Perhaps this experiment is better
to be performed in a Rodeck?
(solid head/block assembly).

>
> Also, of possible interest:

Catepillar openly admits experimentation, but they have also reaffirmed
that fact it does not add power, but does help to greatly reduce
emissions that are special to diesel motors.

But the key to mixing water and gas, is alcohol. Alcohol readily
dissolves water.

Anyone know of a good prescaler chip that will accept an RF input
between 50 kHz and 1.8 GHz, and divide by a constant of at least 4?

I'd like to add a frequency counter to a homebrew tracking generator
(which is sort of a Tek TM-502 clone), and need the ability to cover the
(492) spectrum analyzer's entire range on its lowest band. Most > 1 GHz
prescaler chips seem to be dynamic devices that either go into
self-oscillation, or don't work at all, below a certain point.

Any suggestions appreciated...

Tim:

You would do well to pick up a copy of the W1FB QRP Handbook from the ARRL,
It has lots of simple plans for VFO's Recievers and transmitters, although
it's all solid state. It will also introduce you to the mixing shcemes which
are used to put the VFO on different bands etc. Not sure if you have a
specifc interest in tubes but the higher wattage resistors make those older
projects difficult unless you have a well stocked junk bin.

: to>Tom

: Only problem - they don't LOOK 1920s.....

I put together an rf deck for a TRF medium wave broadcast
receiver using interstage coils made from #24 awg on empty
toilet paper tubes. I dipped the tubes in laquer and let
them dry first so that they dont absorb moisture during
use. Then I spray painted them and wound the coloured
enamel covered wire. Looks pretty good. I was using
6K7G remote cutoff pentodes for the 2 stages of RF amplification,
a 6C5 or 6J5 plate detector and 6K6 audio stage.

You can find all sorts of diameter tubes to use made
out of cardboard from the grocery store and calculate
of turns for that particular diameter etc....

I did not have to shield my aerial and 2 interstage
coils... It is recommended for stability...I layed out
the components far enough away that I did not experience
any self-oscillation.

Construction of the inductors in this way also gives
the machine a nostalgic 1920's look in addition to the
glowing shouldered 'G' type bottles.

I was able to save a beautiful low-boy cabinet that
I found in a thrif shop which was missing the radio.

I built the radio on an acrylic deck... but for experimentation
I used a pine board.

If anyone wants details, pictures on a home-brew TRF
broadcast receiver, let me know..It was fun!

Also built a superhet using AA5 bottles with S-meter in
an aluminum chassis and wound my own adjustable-coupling
IF, RF and Osc coils....bank-wound on acrylic rods.

That was even more fun!

"What good is it?"
-It's coming from out there.
"Out where?"
-Space.
"Just Space?"
"You have spent thousands of dollars on
transistors...and...and...circuits and
cathode ray...what good is it?"

-Well, it's..... interesting.

Unfortunately, it looks like their prescaler kit has the same problem as
the MC12074 chips I usually use for this sort of thing -- it goes dead
below X MHz (in Ramsey's case 10 MHz). I want something that'll go all
the way from 2 GHz down to DC, or nearly so.

I could live with some loss of coverage at the high end -- if the
counter drops out above 1.5 GHz or so, that's fine. The lower HF end of
the spectrum is more important to my application.

What speed should the water be injected 300 bps or maybe 56 k bps?
Should it be AM or FM modulated?

Around here Scope soldering irons use 30amp 240V-3.3V transformers. If you have 115V versions you could wire the outputs of two in series for 6.6V or 10V.

In the days of high compression engines and only low octane fuel I built a few water injection systems that worked very well to reduce engine knocking and running on. I'm an engine tuner, not a rocket scientist so I'll leave the theory to the experts, but I will tell you they work.... with an added benefit of permanently de-coking your CC's.

I usually used a windshield washer tank and pump plumbed to a spinal syringe inserted in the intake manifold. The electrics were vacuum operated, I usually used a vacuum advance diaphram connected to a microswitch with a spring on a threaded fitting to adjust the moment of vacuum that was suitable for the particular engine. Sometimes I had a manual override switch to inject when towing up steep grades or other high demand situations. I never did dyno testing on the units, but they certainly ran better.

The HP10811 crystal oscillator has been used in HP electronic counters for several years. I'd like to find out a little more about these timbases, particularly when was it introduced, and when was it surpassed by the newer timebase? I'd also like to find out what counter models used the 10811. Why? I'm looking around for a used HP counter and would like to get something not too old, with an ovenized timebase. It would help a lot to know which models have a good stable ovenized timebase before looking at the surplus dealers etc. Was there another timebase (crystal oscillator) that followed the 10811 but preceeded the current E1938A?

Thanks!, Chip Owens, NW0O, Boulder, Colorado

<r.hopkins@sausages.ic.ac.uk> writes:
> The frequency of the magnetron is chosen such that the microwave energy
> causes water molecules in your pot-noodles to resonate.

Nope, the frequency of 2.45 GHz was chosen because that's an ISM
(industrial, scientific, medical) band. Water resonates at a higher
frequency (22 GHz I think??). Older microwave ovens operated in the 900
MHz ISM band. The heating is from dielectric loss in the material so
polar stuff (like water) tends to heat up faster than non-polar stuff.

> 1KW of
> microwaves resonating water heats it up QUICKLY. The reason the

> microwave oven magnetron, since you could literally boil someones brain.

The particular frequency is not as important as the power level (unless
you pick some freq that your head resonates at). Any KW RF transmitter
is going to heat things up, esp. if the wavelength is comparable to the
size of the human body.

Story time! Prof. Robert Pound here at Harvard Physics was
experimenting with microwaves to see if he could heat people instead of
entire rooms. He purportedly bypassed three interlocks to rig his
microwave oven to run with the door open. He said it felt like standing
in front of a campfire -- a nice warm glow. Needless to say, DO NOT TRY
THIS YOURSELF.

> Hence my reason for saying loose the thing! The waveguides in the oven
> may be what the aforementioned ham used in his set up. The magnetron can
> only be used if very well screened. I'd strongly advise against trying
> though.

They were working with a microwave oven magnetron. I would like to
speak with anyone who has actually tried this or has references to
articles on using consumer magnetrons as ham transmitters. You see,
I've got this spare (brand-new) magnetron sitting in the next room...

I also strongly advise against experimenting with these things unless
you know what you're doing.

Magnetrons are a kind of free running oscillators and they are not
crystal controlled at all. Not very frequency stable. I doubt it is
possible to tune a magnetron from 2450 MHz to 2250 MHz (?). The
frequency is determined by the structure and size of the resonant
chamber inside the magnetron. These beasts are usually pulse devices,
not so good for continous operation.

If you want power at microwave you should try a TWT - Travelling Wave
Tube. These are broadband devices. I have one low power type, bu it
has an amplification of 36 - 43 dB from 2 - 4 GHz. The output is max
50mW (RCA 4012/A1157)

David,

I'd love to see which "supporter" has "admitted" this!
Anyone that mistakes the GEET for water injection has little understanding of it. Water injection is an "add on" that simply supplies water to aid combustion. The GEET does not need water at all to work. At the same time, in a slightly different configuration, it can burn large amounts(up to 85%) of water with little hydrocarbon fuel. Either way I fail to see how it can be confused with water injection.

Thanks....

Grant

DON'T MESS WITH MAGNETRONS AT HOME!

On 1998-03-19 r.hopkins@sausages.ic.ac.uk said:
r.>fan with usual motor. For goodness sake, get rid of the magnetron!

r.>high power amplifier, but DITCH THE MAGNETRON!
r.>--
r.>Hoppy

Don't worry; most enquirers would be told "already sold" - for the transformer, rectifier and capacitor let alone the microwave. They would not be able to answer the questions I would ask of anyone wishing to negotiate.

Incidentally what IS the microwave absorbtion frequency of the water molecule? I should know, as I started professional training in airborne radar in September 1957; however for obvious reasons we concentrated on the "window" frequencies.

I suspect (judging by the physical size) that it's for between the 3 cm and 10 cm windows. Although we did have fun cooking sausages (at a safe distance) with an 800 watt communications uplink on the roof of an Edinburgh hotel, during lulls in the Commonwealth Conference of about 5 years ago. THAT was on a window frequency but sausages seemed to absorb it quite well. (It was one of 2 links duplicated for reliability. Just as well.)

I wouldn't actually DITCH a magnetron. Keep it for repairs possibly; or use the magnets as fridge magnets. Although (wistfully) it WOULD be fun if it could be tuned into one of the amateur allocations.

Which are: (approx wavelengths in cm) 23, 8.7, 5.3, 3 (2.8 for schools).

The more I think about it, the more I suspect the cooker magnetron could be pulled onto one of the experimental microwave communications frequencies.

Licensed power is limited to 26 dbW relative to 1 watt - that's about OK.

I have a 1936 book about magnetrons, published in Berlin by Springer-Verlag. FUNNY! I'm sure the RAF instructors said magnetrons were invented in the UK.....probably another case of many people having

the same good idea at about the same time, and a veil of secrecy descending.

I'd be glad to hear from anyone who has tried altering the frequency of an oven magnetron. As the Q of a molecular resonator is rather higher than I'm used to, it might not be necessary to shift the frequency very far. By varying the voltage or the magnetic field I expect. Leaving it not particularly difficult to frequency modulate.

As regards running it full power outside a metal cabinet, it looks as though it would not be very difficult to have it feed a waveguide and then a horn to a dish, although direct feeding the dish might be possible.

Unmatched outputs in this field, though, tend not to last very long!

And yes, I would certainly not stand in the beam. (Some of my colleagues circa 1958 thought it was an OK method of family planning.)

(Another Q: does anyone know what frequencies and powers are used nowadays for human diathermy? AND whether 50 Hz and 60 Hz fields have proven biological effects - because I coud get worried about my electric blanket!)

Thanks for raising so many interesting queries.

DEFINITELY NOT FOR HOME EXPERIMENTATION!!!!!

P.S. LIST (of the VINTAGE and AMATEUR rigs and parts I'm hoping to take to the swap/auction at SHIFNAL on 22 Mar 98) by email on request.

The microwave oven ATV transmitter project was written up several years ago in RF Design magazine (for
sure) and also in QEX (I think...) As I recall, the author varied the B+ voltage on the magnetron to
control the output frequency. The ATV signal he was transmitting was FM (not AM or VSB). Coupling the
output of the magnetron into a transmission line was a non-trivial problem :-) But it apparently worked.

The issue of RF Design with this article had a great picture of the transmitter on the front cover. It was
a conventional-looking microwave oven with door removed and an aluminum chassis with a couple big power
tubes sitting inside.

I think I saved that issue and I'll try to find it tonight.

Source record: 84772

One thing you might look out for is the possibility that the volume control actually controls DC bias to both of the channel amplifier chains so that one pot could actually set the volume for two amplifiers. If that is the case, then the problem is somewhere else in the bad channel. This is easy enough to test for if you have a scope or an audio signal tracer. Just put the tracer on the terminals of the volume control and see if what is there is a varying DC voltage or audio. If it is a varying voltage, then the volume control is still good, assuming you like the way it works on the good channel.

If it is the usual double pot that a lot of stereo amplifiers use, you are in luck because the remaining good half is a carbon copy of the bad half minus the damage. That way of thinking is useful when working on a stereo system in which half of it still works. Try to see where the two halves start to differ.

If the double pot is half good, use an Ohm-meter to read the value of the good half if it isn't printed as several have suggested, and then look for a replacement.

Pots have three terminals and the center one is often times the wiper which moves like a clock hand around the carbon or wire resistance element whose ends are connected to the outside terminals. Depending upon which outside terminal you choose, the resistance will drop to a short as there is less element between the wiper and the end you are connected to. At the other extreme, the resistance is about the same as that read across the whole element. If the control is absolutely shot, the element may be broken or warn out at one end and that end may be isolated from the rest of the circuit. You will see the resistance go from some value to completely open when you turn the wiper past the break.

Good luck on your trouble-shooting.

For goodness sake, get rid of the magnetron! Fire one of those up
outside
a protective metal sceen (called a micowave oven) and you risk seriously
injuring youself. The frequency they use is also strongly absorbed by
water (this is no coincidence!), and so will not propogate very well at
all. The transformer could be used for a high power amplifier, but
DITCH THE MAGNETRON!

Now this puzzles me ... I dimly remember that a few years
ago, somebody wrote about a 2.45 GHz ATV trx which was built
using parts of an old microwave oven. I suppose he or she
had used the magnetron. There should have been even an article
in a ham magazine, but where?

Another point: Isn't the typical frequency of around 2.45 GHz
used in the microwave ovens simply because it is in an ISM band
(i.e. a frequency range which is also assigned to industrial,
scientific, and medical applications besides communication),
and it's quite a bit off any resonance of water molecules?
I thought it's merely the resonance in the cavity of the oven
and the high power which is responsible for the heating.
Perhaps somebody knows about a printed reference?

Of course, one should always be careful with high power RF.

Jan-Martin

The frequency of the magnetron is chosen such that the microwave energy
causes water molecules in your pot-noodles to resonate. 1KW of
microwaves resonating water heats it up QUICKLY. The reason the
magnetron is so dangerous is not just becuase it is very high powered,
but simply because anything it points at which has water in it will get
very hot. This includes people. A very good death ray indeed would be a
microwave oven magnetron, since you could literally boil someones brain.
Hence my reason for saying loose the thing! The waveguides in the oven
may be what the aforementioned ham used in his set up. The magnetron can
only be used if very well screened. I'd strongly advise against trying

though.

Motorola ECLinPS parts MC100EL33 or MC10EL33 - a differential input
divide by 4, works up to at least 3.4GHz with a 150mV input swing
centred around -1.32V (for the MC100EL33 pat). The part outputs a
nominally -1.32V reference voltage. It is a flip-flop based divider,
and should thus go down to DC.

You can buy it in small quantities ex-stock from Newark within the USA
or from Newark via Farnell if you are outside the USA.

Yes, there was an article in Ham Radio Magazine, cannot remember which issue, that modified a microwave oven for amateur radio use. It was a very elaborate conversion, he built a high voltage regulated current power supply with the regulator tubes in series with the magnetron. Magnetrons are current tunable over a limited range. They can be injection locked for frequency stability.

The primary water resonance is at 24GHz. 2.4GHz was used because of the industrial spectrum authorization. Some microwaves were manufactured using a 900MHz source. I have personally used frequencies from 1Ghz through 10GHz to heat water. All of them can be found to be effective.

Well, the tracking generator works in conjunction with a spectrum analyzer that goes from near-DC all the way to 1.8 GHz on its first (non-harmonic) band. The analyzer has its own readout at 1 MHz precision, with +/- 5 MHz accuracy. I plan to use the counter logic with a fast gate to obtain improved precision and accuracy by actually sampling the output from the tracking generator as the sweep crosses the center-frequency point.

If the prescaler doesn't go all the way down to DC, I'll have to either install a manual range switch like all the cheap pocket counters have, or resort to, as you say, a scheme that uses the overflow output from a lower-frequency part to enable/disable the prescaler. The latter option really won't work reliably, simply because the frequency I'm trying to measure will be changing rapidly. A microcontroller will handle the math needed to determine the analyzer center frequency based on the sweep rate and the number of cycles counted in an interval to either side of center, and it'd be too easy to tune the analyzer to a setting that would cause the prescaler switchover to occur in the middle of a gate period.

Gonna go chase down a Motorola part that Bill Sloman mentioned, sounds like it might be what I'm after.

Hey, that sounds like just what I'm after. I'd already searched the Motorola web site for "prescaler", but it missed the ECLIPS parts completely. Thanks, will check it out.

(Stupid question time: what's VCC on these things? Ground, like other ECL parts? The data sheet at http://mot2.indirect.com/books/dl140/pdf/mc10el33rev3a.pdf is not great -- it doesn't give a clue as to how to actually hook the thing up. I'd assume for a single-ended AC-coupled signal you're supposed to run the VBB reference output to the desired CLK input through a resistor of who-knows-what value, and ground the other CLK input?)

UNLESS, of cuss, you want to put it into a case and add a cuppla
frequency doublers to it.

Then you would have several hundrew watts of 10-gig EHF.

You could try moonbounce offa the moons of jupiter, if you could
make a big enuff ear to rec the bounce with.

but the caveat is real; don't fire that up outside the box it came in,
or one made for keeping what it makes inside the box it is made in.
Or something.

A good generic recommendation is to go to a used book store and seek a
Tube Manual from any of the manufacturers like GE, RCA, etc.

These manuals included theory and application on tubes, as well as the list
of tubes and what they were used for.

Hope this helps.

Oh, BS, Hoppy. You haven't a clue what you're talking about. The first water absorption resonance frequency is 23 GHz. That's 10 times the frequency of a home microwave oven. Microwave ovens operate in either the 902-928 MHz ISM band or the 2.45 GHz ISM band. Large commercial kitchen units typically use the lower frequency while the home units typically use the higher frequency because of the smaller heating cavity required for home cooking.

They operate by ordinary dielectric heating, no resonances in the food are required or desired. They'll heat any polar molecule in their field. Water is a weakly polar molecule, so of course it will be heated, but fats and amino acids (protein building blocks) are much more strongly polar than water, and are heated much more readily.

Any RF field of high enough intensity will do this. There is nothing special about the frequency bands chosen for microwave oven operation other than that they are allocated for ISM use by the ITU. There are even a couple of ISM bands at HF, used for drying plywood. They work exactly the same way. Water resonance has nothing to do with it. The frequency chosen depends on the cavity size needed for the heating application, and the skin depth to which heating is desired. It's as simple as that.

The inverse square law holds just the same for magnetron generated 2.45 GHz RF as it does for 3.5 MHz RF generated by a pair of 813s. Either one is dangerous if you stand close enough to the source of radiation. Neither is dangerous as long as you keep a respectful distance from the antenna so that the power density falls to a safe level (typically specified in government standards as less than 10 mW per square centimeter to avoid RF heating problems in flesh).

Please let me know the source(s) for schematics for linear amplifiers
using 813s. I have two 813s that are about 20 years old and I want
to construct an amplifier...just for the fun of it. Also, any information
on schematics for 2,000 volt, 500 ma. power supplies would be
very much appreciated.
Thanks for any input.....K4ZMR, John

I have a quantity of Hammurland air variable capacitors, type MAC and MAPC, new in the box. Values from 5pf to 35pf. Also I have B&W and AirDux miniductors, various diameters 1/2" to 1", new in the box. Also I have two Sangamo transmitting caps, .002 @ 10KV, 13 AMPS.

I have shielded coils. These are made by Cambion. If you are not familiar with them, they are a metal shield cab that encloses a hollow torroid spool (with a lid) that has a tunable slug. Brand new, still sealed in the plastic wrappers.

These are great homebrew items that I would like to trade. I need the following tubes:
6BQ5, 6EA8, 6U8, 12AT7, 12BY7, 6550, 7189. New tubes only, please, in original box. Also looking for can capacitors, 250MFD @ 450VDC and a matched pair of rf transistors, MRF245.

Let me know what you have and what you are interested in.

Which models would be most likely to contain a 10811? I'd certainly
consider buying a parts unit for the OCXO, especially if I could
upgrade my 5345 and use the 10544 for something else. (But then
I never did discover why the Systron-Donner I stripped had a
3 MHz (!) OCXO...)

I like mine, but I'd like it better if it weren't so noisy.
Turn it on, and you'd think it had a 2 horse squirrel cage
blower in there! I tend to turn it on only when I need to
make a measurement, then shut it off right away.

Yeah, that fan sounds like a 737 warming up. :-) I think they use the same fan in the 8656A signal generator, which unlike the 5345A runs ALL the time whenever the generator is plugged in. Ah, the days before people had a clue about how to build efficient digital ICs....

> assume for a single-ended AC-coupled signal you're supposed to run the
> VBB reference output to the desired CLK input through a resistor of
> who-knows-what value, and ground the other CLK input?)

ECL is normally biased between 0V (Vcc) and something around -5V (Vee).
The 10E parts are specified for Vee at -5.2V +/-5% and 100E for Vee
between -4.2V and -5.46V. the parts run faster if you make Vee even more
negative, down to the -8V absolute maximum rating, but you have to be
careful to protect the parts from over-heating.

It is entirely practical to run ECL from TTL rails, with Vcc at +5V and
Vee at 0V - Motorola call this PECL, and their data book includes data sheets
for PECL to ECL and PECL to TTL translators in both directions (which doesn't
guarantee that you can buy the parts).

You don't do this if you can avoid it. The +5V rail in a TTL system is much noisier than the 0V rail in an ECL system, and it is very easy to blow up the output transistors of an ECL part biased for PECL operation - any brief connection from output to ground burns out the transistor.

When HP up-graded their laser interferometer system in the early 1980's (?) by adding some ECL components, biassed at PECL levels, they compounded this problem by connecting a complementary output to a coax outer, and (if memory serves) something like 90% of the service faults on the relevant boards were due to dead ECL drivers.

To connect the thing up, remember that the differential input stage is a long-tailed pair. Both inputs have to be fairly close to Vbb.

For a simple single-ended AC-coupled input, I'd connect the inverting clock input directly to Vbb, and connect the non-inverting clock input to Vbb with about 1k. The 75k internal pull-down resistors draw about 50uA, 50mV over 1k, and the input transistor can draw something of the order of 100uA when it is turned on for another 100mV, which is of the same order as your 150mV minimum input swing, so it isn't an ideal solution.

I'd be inclined to monitor the average voltage at the non-inverting clock input with an op-amp on the other side of a high resistance low-pass filter, and drive the input through a 100k or so from the output of the op amp to actively hold the average voltage at Vbb. Might even go as far as including a pot to the trim the target voltage to compensate for any offset within the input long-tailed pair.

A transformer-coupled input would be even nicer, but my best transmission-line transformer so far was only good over the range 50kHz to 150MHz. Keeping the winding length shorter than a quarter wavelngth at 1.8GHz would make it difficult to get enough turns for a decent lower frequency limit.

[deletions]

This suggests a point that I have yet to see raised in all the hand-wringing about RF safety, which has worsened to the point of affecting radio law in a number of countries without, in my opinion, any conclusive proof of detrimental effects of low-level HF fields. (Yes, yes, we all know that strong fields of the right frequency can cook foods, legendary urban pets and evil talking dolls. :-D) The point is this: in the age of HF diathermy--it was big in the 1930s and 1940s until I don't know when--thousands, perhaps tens of thousands, of people experienced HF diathermy treatments. (Early on, for instance, diathermy was big at health clubs; skywave-propagated inteference from a number of these machines, dubbed "The Shadow" after a popular radio program of the day, made minor headlines for months in 1936 until its source was discovered and the machines' leakage reduced.) That being the case, it should be possible to do a pretty strong study of the effects of strong HF fields on people--HF fields strong enough to *heat tissue*, because that's exactly what diathermy was about.

Power went up about 15hp, due to the compression increase. This was on a small 4 cyl.

> And the gains would be so, if there was probably a roughly 30% reduction

> > It is half water and half naptha gas. It works in diesel or gas engines.

I don't think they were looking for a power increase? Just a cheaper, cleaner alternative. There ARE major problem when using water in this way. When you are feeding the engine larger amounts of water like this, every time that you shut off the engine you end up with water in the cylinder. My sources said that engine life, when using large amounts of water in this way, was cut dramatically. I have a video of Gunnerman running this fuel in his Porsche,

it didn't seem to suffer any power loss. But if engine life is reduced I'd hate to be replacing a Porsche engine every 2 years.

Actually, alcohol does work fairly well for this. Another alternative that works at least as well, that almost everyone has on hand is liquid dish washing soap. Only takes a little to mix a fairly large amount of water with the gas. Using a strong dish detergant, some isopropyl, and a few other surfactants I was able to mix 35% deionized water with gas. Car ran pretty decent. It did make readily apparent the weakness of my very old point ignition however.

I don't think it is practical to feed this type of fuel into an engine via conventional fuel systems. I also forsee problems with it during our rather cold winters.

Yes, the magnetron was invented in Britain. A bit of the history, from "Radar: History of a Need-Fostered System" by H. Warren Cooper, _Microwave Journal_, May 1989:

"In August 1940, the British Technical and Scientific Mission to the United States, led by Sir Henry Tizard, brought to the US details of the highly secret work in Britain on the resonant-cavity magnetron, airborne radar developments, and information on the proximity fuze and the jet engine. As part of the Tizard Mission, E.G. Bowen brought with him one magnetron of 12 that had been made at the GEC Research Laboratories in Wembley, England. The magnetron had been invented by Boot and Randall at Birmingham University in 1940. . . In his book _Radar Days_, Bowen says that 'perhaps the greatest single contribution made by the Tizard Mission was to introduce the resonant magnetron to the USA.' Over a million magnetrons were produced in the US and incorporated into hundreds of thousands of radar sets in every theater of war. . . [After September 1940], the magnetron was demonstrated at Bell Laboratories in Whippany, N.J. . . After the demonstration . . . it was agreed that the way to go [to achieve a high power microwave source] was to copy the eight-cavity magnetron, and Bell Laboratories was contracted to manufacture 30 magnetrons immediately. These were then distributed to GE, Westinghouse, RCA, Raytheon, and other manufacturers for mass production."

Britain, of course, had its hands very full at that time, which is apparently why the initial production was done in the U.S.

Yes, the British did indeed invent the crucial cavity magnetron, but the split anode magnetron existed for some time before 1940. The split anode magnetron was not as efficient, but allowed operation over a wider frequency band.

Hi, Gary,

I have a couple questions on it:

o If I wanted to use it as a bandscope, do I need any of the tuners?
will it take a 10.7 MHz I.F. directly?
o What is its power requirement and do I need to have it isolated from
the receiver that I'll pull the I.F. out of? (In other words, any problem
running off the same 12v supply I'm using now?

Thanks much!

>So what changes were made in the E1938A, and how much better
>is it than a 10811?

First, what is the same: the quartz resonator has the same
guts (i.e. gold plated quartz) as the 10811, but in a low profile
package. Also, they both work at 10 MHz. :-)

What is different: everything else. New patented oscillator
circuit, new patented oven, new digital oven controller,
different size, hermetically sealed.

How much better:

temperature range to 85 C vs 70 C.
tempco: 2+ orders of magnitude better
humidity: 3+ orders of magnitude
pulling, pushing: 3+ orders of magnitude
retrace: 1 order of magnitude
aging, phase noise about the same
acceleration sensitivity, slightly worse

>
>Which models would be most likely to contain a 10811? I'd certainly

It's not a model thing. If the counter was made prior to about
1980, it will have a 10544; if it was made later it would have
a 10811. Models whose lifetime straddled 1980 hence could have
either.

Well, that's what you get when you make a whole counter out
of ~ MECL III and clock it at 500 MHz. The 5345 is for the
counter enthusiast, not the casual user :-)

Lovelock of Gaiea fame in 1950s applied rf heating to warming up
deliberately frozen rodents to demonstrate that they could be "brought
back" uniform heating was the requirement.
He asserts that the also used the setup to cook his baked potatoes for
lunch and therefore invented the microwave cooker. Dont know what the

rodents tasted like though:)

The fan in the 8656 runs to keep the power transformer cool,
which also runs all the time; long story how we got ourselves
into this predicament. Also, the 5345 doesn't look all that bad
when you compare it to a 500 MHz Pentium chip. I think they
pull something like 50 watts (?).

That's interesting to know. I was under the impression they were just trying to keep the CPU and ROM/RAM banks from melting down. So if I were to add a quick-and-dirty triac preregulator to the primary side of my 8656 (or just substitute a more modern power supply altogether) could I turn the fan off when the generator is in standby mode?

What was the deal with that, did H-P get stuck with a bargeload of lossy transformers, or something?

Mine is the earlier 'A' model; sounds like they revised the power supply
to take care of the overheating issue in the later ones.

Source record: 84799

Well, I recognize at least a couple of these:
6BQ5 is a power amp pentode.
0A2 is a heaterless (cold cathode) Voltage Regulator (VR) tube, 150 volt
regulator
12BE6 is a pentode, used as I recall for mixing and RF/IF amplifying
12BA6 is a receiving tetrode, again used for osc/amp RF/IF
35W4 is a half-wave rectifier used in '60s tabletop receivers
As to what to do with them, unless you're doing radio restoration I
doubt they're much worth. Advertise them and see if you get any takers.
I've had literally hundreds of tubes over the years, most recently a
large collection given me by a ham's widow, I took them to various
hamfests and literally had to give them away to get rid of them.
Maybe you can get a few bucks out of yours, give it a try.... but if
they won't sell, please try to GIVE them away to someone rather than
consign them to the trash bin.

3149. Sodium Vapor Fixture Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-20 00:00:00 UTC
From: "Richard F. Gillette" <w9pe@starnetinc.com>
Message-ID: <35132C2F.9C67B4D1@starnetinc.com>
Source record: 84808

Had a sodium vapor fixture go intermittent. Changed photo cell.
Changed bulb. Still intermittent.
No schematic. Tracing it out it looks as so: line, photo cell, tapped inductor, bulb, return. From the tap to the bulb is a semiconductor (plastic transistor package with base lead cut) in series with 7500 pf mica. From the junction of the semi conductor and the 7500 pf are 95 ohms (unmarked part measuring 95 ohms) in series with 2.6k (again unmarked part measures 2.6k, maybe varistor) to return. As the unit is intermittent I can not trust any measurements. Now I have replaced the entire unit so I do not need to repair same, but as an engineer I am curious what the starter consists of. Anybody have a schematic with typical values?

I haven't had a problem but don't leave it on long. Your right it could be
a problem in the heat.

How about a wide rubber band? A 3/4 inch piece of bicycle inner tube might
do it and wouldn't look too bad.

3153. Tandy 49.8 "Walkie-talkie" to 6 metres?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-21 00:00:00 UTC
From: b.h.jarvis@hw.ac.uk
Message-ID: <6ev0ff$j3b$1@cn1.hw.ac.uk>
Source record: 84652

Further to a similar thread, I've just come across the Tandy Cat No
60-4024 "Space Patrol" at £8 + a "square" 9 V battery.

It's a rushbox; and contains no crystal. It is labelled MPT1336 Exempt,
frequency band 49.82 to 49.98 MHZ (sic).

They are "on offer" and you can buy any number at the fixed price;
allegedly any 2 work together over up to 200 metres in open country.

So presumably the transmit frequency is random (within that band) and
the rx "locks" onto a strong signal in the band, as regens do.

I'm not sure whether the modulation is meant to be AM or FM.

There is a "Morse Code" button which produces an audible audio note.
The PCB MIGHT fall into 2 sections, one having 6 transistors, the code
button, and one coil; the other 2 transistors, 2 coils, and just
possibly a tiny crystal disguised as a metal-can electrolytic, GLUED to
the (?) tank coil.

Even if that's a crystal, it should be pretty straightforward to get it
into the amateur allocation of the 6 metre band.

However, to make a tube TX (and why not regen rx? Both at once?) might
be much easier.

Anyone had recent experience of 6 metres? Or odf modding these
rushboxes? Is AM frowned upon? And Class B licensees using Morse?

Thanks in anticimapation,

Dear All,
I am designing a VFO, first time I've done an ocsillator beyond simple TTL clock circuits.

I'm a little confused about sizing and selecting a choke for the collector/drain/anode side of the active device.

I have an ocillator that is intended to run between 4.95 MHz and 5.55 MHz. The self resonant frequency of everything in the 500uH and above chokes that I can see is near or below this.

Do I:

1) String several lower value chokes that have self resonants above my frequency range together to get the size I want. Or -
2) Pick the largest value where any harmonic of the self resonant frequency is outside of the range that I want. Or -
3) Ignoreit and just put the figure thati want in?.

I am looking for the approach that will give guaranteed results, arn't we all :=), as several people may have to build this circuit and I want things fairly repeatable.

Regards

Robin

From: andrew@phicom.dungeon.com
Message-ID: <3513845a.0@ispc-news.cableinet.net>
Source record: 84814

Hi,
I'm looking for a big transformer for a QRO (by UK terms !) valve
amp using a 4cx250b valve (or even a pair).

Has anyone any experience with microwave cooker transformers - a
friend reckons that he has one that is about 2-2.5kV on load - ideal !

He warns me its air cooled, but I figure the duty cycle matches most
amateur use (unless you go for 1 hour overs on FM !).

Any comments ?

73's

Andrew,

Some number of years back I built a pair of 813s with a microwave transformer for the plate transformer. Worked absolutely great! I never had a bit of problem. Go ahead and use one. Good luck with your project.

Lot of 10 NEW 14 volt grain of wheat light bulbs. Most rigs use 12
volters. These are 14 volters and put out just about the same amount
of light on 12 volts as the 12 volters do. They should last virtually
forever once replaced in your rig. This voltage is quite hard to find.
Mostly one ends up using 12 volters only to have to replace them again
in a short time. I found these at Dayton one year and bought up all
the guy had. Lot of 10 grain of wheat bulbs $15 postage paid to you.
Email me if interested. Also have some of these up on eBay if you want
to play the auction bidding game.

I have great respect for me, and I don't know Gary.
The fuel etc topic started as as an argument whether electronics
could cause fuel handling in an auto to be improved to any degree
that would justify lots of money being spent or invested.

I am interested in all kinds of electronics, as are many hams,
most of whom have departed this do-nothing NG long since.

Mostly what remains are those who are totally ignorant and spend their
time in nay-saying.The active people eventually go looking for activity of a
productive sort. As will I.

Lou (The world is full of people who got no idea what's going on, but
who know a thousand reasons why it won't work) Hinshaw

No need to flame me, because this is gonna be my last post.

Self-resonance in a blocking choke or capacitor is not always the evil thing it's made out to be. In some cases it can actually raise the effective impedance of the component in question. However, to be sure, you could simply use a smaller choke with fewer turns / thicker insulation, and avoid the issue completely. You don't need 15.7K of reactance in a VFO -- a couple K will usually be enough. Try a 50 or 100 uH choke if the 500 uH choke gives you any trouble in the actual circuit due to self-resonance.

It shouldn't be that hard to find a 500 uH choke that's self-resonant much higher than 5 MHz, though.

3173. FREE Icom newsletters from International Radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-21 00:00:00 UTC
From: Pierre Constantineau <pierre@cmpe.ubc.ca>
Message-ID: <351421E6.6F08EEE2@cmpe.ubc.ca>
Source record: 84827

I have a series of Icom Newsletters which need a new home.

These are published by International Radio and Computers Inc.
I have issues 11-122. From October 1980 to Feb. 1992. Some (2 or 3) might be
missing.

2-3 inches of letter format information on fixes and mods to Icom radios.

Pay only for shipping. (5$)
I might consider swapping for something else.

Please reply direct to me.

Thanks

> you have something like this.
>
> 73,
> K-K

You can get old large mil multiple pin connector sets and
remove the pins. Then, on the chassis mount side, drill the
center of the insulator to accept a bananna socket. Install
the chassis mount connector, and beside it, put a #10 stainless
bolt with lockwashers, extending the threads to the outside
world to receive a ring lug.

Use RG8 or RG213 cable. On the plug side, MECHANICALLY SECURE
the braid to the connector shell, and extend the braid
outside of the connector shell. At the end of the braid,
firmly crimp a ring lug for a #10 stud. Remove the insulator
containing the pins from the plug. Attach a bananna plug
(uninsulated, ifyou like) to the center conductor. At this point
the center conductor and bananna plug are just dangling in free
air, not mechanically secured to anything.

To connect:
move the plug into close proximity to the socket. Connect the
ring lug on the shield to the chassis mounted #10 stud. Manually
insert the bananna plug into the bananna socket. Then, screw the
plug shell onto the chassis mounted socket.

I, and others, have used this technique to successfully
transport 3kv at 1 amp, etc.

WARNING- IF THE GROUND CONNECTION COMES LOOSE, THE AMP CHASSIS
BECOMES HOT WITH THE B+!!! MAKE VERY SURE THERE IS NO POSSIBLITY
OF THE GROUND STUD COMING LOOSE, OR THE RING TERMINAL FAILING.

WARNING- DO ALL OF THIS WORK WITH A JUMPER DIRECTLY ACROSS THE
B+ SUPPLY FILTER CAPACITOR. THIS STUFF IS LETHAL, AND YOU
WILL NOT GET A SECOND CHANCE.

I used an aux ground wire for safety, and I encourage you to do
so, as well.

This technique is inexpensive, and safe after responsible
installation. RG8 or RG213 can handle more volts and amps
than any ham amp will use.

Good Luck,

Rod KM6SN

Real sausages come as a string, the casings are twisted between the
links. Mil-grade magnetrons made by Litton Industries or AMANA
Microwave do a fair job (keep you links covered with a paper towel!).
I prefer my links boiled in beer, with just a little mustard.

>
>o If I wanted to use it as a bandscope, do I need any of the tuners?
> will it take a 10.7 MHz I.F. directly?

The tuner contains the mixer and VCO which is swept to create the
spectrum display. So you have to have the tuner. If you took your
receiver's IF directly to the spectrum analyzer's IF, there'd be no
sweep.

The way this thing works is that a sawtooth waveform is generated
to drive the tuner VCO. This causes the frequency sweep. The
sawtooth has a DC offset which is adjustable, and the magnitude
of the sawtooth is also adjustable. This lets you set center frequency
(with the DC offset), and dispersion (span) with the sawtooth magnitude
control.

The VCO is mixed with incoming signals in the tuner's mixer and
a 10.7 MHz IF is extracted. This is fed to a log amp and envelope
demodulator. Selectable filters are provided to set the resolution
appropriate for a given span. The larger the span, and the faster the
sweep, the broader filter you have to use. For panadaptor purposes,
you want to use a small span and a relatively slow sweep in conjunction
with a relatively narrow filter.

>o What is its power requirement and do I need to have it isolated from
> the receiver that I'll pull the I.F. out of? (In other words, any problem
> running off the same 12v supply I'm using now?

There shouldn't be a problem powering it off an existing supply.
You want to couple to the IF in such a way that you don't load it.
A small value capacitor should work.

Realize you have to provide an oscilloscope for display. With
mine, I used a 14 inch Wavetek XY display I happened to have
instead of tying up one of the bench oscilloscopes. I built the
spectrum analyzer into the Wavetek's case and tapped power
from its power supply. That worked great because I could
see the spectrum from across the room on that big display.

Sweep linearity isn't great with this spectrum analyzer. A
marker generator can be useful to tell you where you are.
For a fixed use like a panadaptor, you could make up a
calibrated gradicule for your display and set and forget
the center frequency and span controls.

Anyways, I know absolutley >nothing about tubes, so I would like these tubes identified(what are they, >what are they used for, etc...), and references to materials about tubes >would be appreciated...

well some might say use them for target pratcie and others would cringe in horror over that comment.

>Here's what I have:
>OA2

Heater less regulator tube. 150 VDC 30 ma.

>6BQ5

Power Pentode. used in audio and RF amps. COmmonly used in CB fianls is the old days. RF output in class C is about 3.5 to 5 watts. In pushpull calls B they can do about 7 yp 9 watts in an audio amp.

>85C5

My RCA tube manual has no listing

>12BE6

Pentigrid converter. Used in the old five tube AM radios. Can be used as an oscillator and mixer in one tube. Five grids in that baby. This is a 12.6 fialment version of the 6BE6.

>12BA6

Remote cutoff pentode. Has nice gain. easily gain controlled thru the screen. Used in RF amps, receiving, and IF amplifiers.

>85A2/OG3

0G3 is directly replaced by 5651A. This is a cold cathode voltage regulator tube. 85 volts at 3.5 ma.

>6AW8A

High Mu triode and a sharp cutoff pentode. Pentode used in TV IF amps and video amps in TVs. The triode in sync separators, verticall

oscillators, or audio phase splitters.

>35W4
Half wave rectifier, ie diode. 360 PIV at 660 ma peak. 35 v filament.

>So, what do I do with them? Anything useful there?

as a I stated above use them for target practice, design a circuit
with them or sell them. An RCA or GE tube manual will give you the
necessary terminology of tubes and design theory.

Source record: 84840

In a rage of ignorance I told my good ham buddy Bill, Sure I'll fix your TR-4C for ya nooooo problem....

After replacing a couple bad tubes etc I got the rig back up and running but noticed the PTO screw was just a little loose and consequently could jiggle a little bit since the bearings were not fully seated. I removed the cover of the PTO, pulled the inductor off the slug to get access to a small hex set screw which applys the pressure to the other end of the screw.

A quarter turn and Im back in business, smooooth... but not to tight. Put the PTO back together, hook all the wires back up and presto I'm off freq by about 150Khz. This was no surprize since I knew the mechanical stress of the screws etc would most certainly cause the PTO to be different. The PROBLEM is I didn't see the paragraph in the manual about "Return to factory for PTO alignment" Detailed information on EVERYTHING ELSE but nothing on the PTO

I'm looking at the schematics and CAN NOT FIND any trim cap, variable inductor, or other in line with the PTO for fine tuning and adjustment. Can anyone help out with this? There must be something outside the PTO for alignment.

Message-ID: <VA.000000c3.01c4265b@together.net>
Source record: 84842

Jorge, Mercury-wetted relays were used in applications where contact bounce was a problem, and electronic/computer debouncing wasn't available. They also have extremely long life due to the 'lubrication' of the contacts by the mercury. I have seen them used as high speed keying relays, data multiplexors and data repeaters in RTTY.

I believe there are very few current applications that can't solve the same problems with electronic switching, hysteresis (schmidt trigger circuits), or software debouncing.

Anyone???

Source record: 84843

Millen connectors are elegant, but UHF connectors and Rg-8
or BNC connectors and RG-8X work fine. You DO have to make darn
sure you don't mix them up with your RF / antenna stuff! If
I had to do this today I'd use TNC (Threaded type BNC)
connectors and RG-8X so they wouldn't mate with any RF stuff.
Radio Shack carries these, and the Millens are REAL hard to find..

Subject: ** FLEA at MIT ** Sunday April 19th Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

It's snowing today so while it sure doesn't feel it..
Officially.. Spring has sprung and that means
the season's first MIT Flea is only a month away...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 19th, 1997
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

Sellers Season Passes are again available until
April 19th for only $50 per space for all 7 meets !!

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

What do you do about adhesive residue? On particularly hot days this could become a guncky mess. Not trying to shoot you down Mark, but I have not had good luck with electrical tape coming off cleanly (maybe I'm buying too cheap a grade :-}).

Try some stretch wrap made for wrapping foodstuffs. A small patch that wraps partiall around the case might be the ticket. No residue and quite reusable. You might be the brunt of a few good natured jabs, but you will not short out your battery pack inadvertantly. Which, by the way, is made tougher from the get-go as Yaesu was smart enough to recess the contacts.

Hope this helps.

3204. Re: Using microwave oven transformers for QRO valve amps ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-22 00:00:00 UTC
From: dcowey@cyberia.com
Message-ID: <6f2cra$ql5$1@news3.microserve.net>
Source record: 84665

Here is my experience,

The ciculating current in the primary seemed very high with no
load on the secondary. One side of the secondary is grounded, and
if you lift it from ground, you will find it is not very well insulated
to survive use 'above ground'. The regulation is very poor and the
output voltage drops by 1/3 after rectification at about 150ma, however
someone told me to remove the 'magnetic shunts' which my transformers
didn't seem to have anyway. All in all, I was unimpressed by the
performance of the units. KD3SH

<...>

The SRF of a choke should normally be at or below the frequency of interest.
The reason is that then the reactance above the frequency of interest will
be capacitive, thus helping to supress harmonics. If the SRF were above the
frequency of interest the harmonics, esp. the 2nd, would be emphasized
rather than supressed.

email them down at Surplus Sales of NE. They have skads of xformers.
Everything from 15kev jobs to 230 amp 6 volt xformer insulated to 50 kev.
(or something like that). Odds are they'll have something you can use.
They've also got a dual supply (can connect them for dual ended supply) and
can give you the mods to make it a variable supply.(was down there today
and asked them about it). http://www.surplussales.com is their URL, if I
remember correctly.

3213. Is MFE131a substitute for 40673???

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-22 00:00:00 UTC
From: RJBurden@BigPond.com
Message-ID: <3514f056.24437491@news.bigpond.com>
Source record: 84674

Hi all,

working on a homebrew receiver by modifying a commercial radio. Receiver is deaf and poking around with CRO suggests RF-amp and mixer are not really working.

This radio was purchased from a hamfest and somewhere in it's history the original fets were replaced by MFE131 fets. Now I think these MFE131 fets may be enhancement mode fets, as distinct from the 40673 depletion mode.

Or am I barking up the wrong tree and the MFE131 should be okay??

Thanks for your help.

Regards,
Richard VK6FKB

Hello there,

I (Cees) am looking for a Analog satellitereceiver.

The reciever must have the following spec's:

1) Analog receiver
2) Freq-range 950 - 2150 Mhz
3) C-Band receiving (Video inverse)
4) Video different I.F Bandwidth's (not a must)
5) Audio frequency's left and right independently tunable
6) 2 LNB connectors (not a must)
7) Menu on screen
8) 200 memory-canals or more.

If you have or know something Please let me know !!

Bay bay <> Cees <> Holland.

Have a look at this:

http://www.mnsinc.com/bry/73khz/g3tdz/g3tdz.htm

Great project for those who want to get on the new 160-190 kHz band OR for
British Amateurs needing a great rig for 73 kHz

The design is for a 73 kHz phasing SSB transceiver, but I am sure it could be
adapted for 160-190 kHz by an enterprising USA ham.

How about it all you W-s ???

For those who might want to try a "never used out of the box" expencive
8877 here is a trick to know if the tube was ever pluged in.
The manufacturer puts a dust, like saw dust but very fine, in the fins
of the tube, when the tube is first pluged in and cooled the dust is
blown away.
If there is no dust in the fins the tube should be considered as good
as a pull.
I thought You would like to know!

Greetings to the group from a first time poster.

I'm having trouble locating a source for the TBA120S I.C. which I need for
a homebrew deviation meter. I've tried the usual suppliers: Maplin,
Farnell,
JAB etc. Any sugestions?

SSB on 73 kHz? You joke!

Why not packet and TV while we're at it?

What's this 160-190 kHz band? USA Only?

Philips/Valvo TBA120AS=TBA120S, while TBA120/SN76660N/TBA120A has
somewhat different connections - it misses some audio functions and
internal coupling capacitors.

Is this a *new* US *amateur* allocation, or the US (QRP?; licence-free?)
'lowfer' band that's been around for some time?

1 watt, any mode, transmission line and antenna combined not to exceed 50 ft., no license. Most of what I hear is beacon and most acitivity seems to revolve around CCW or Coherent CW where the decoding is done via computer over long periods of time. Most of the fellows operating down there have a pretty good understanding of noise and how to listen through it.

Whats the point of covering the front contacts? theres hundreds of radios
with drop in charge contacts that are always exposed... in fact, the 50r
has a set of those charging contacts on the bottom. no need to worry, the
chances of something actually creating a bridge.

You must live in Florida where minus anything is very low. :-)

Actually mercury freezes at approx -40deg (F or C doesn't matter). That is very cold no matter where you go but very rare for electronic equipment environment.

Try Thordarson Meissner. We have what you need off the shelf. And we are local. Our manufacturing is in Mt. Carmel, Illinois. If you call 618-262-5121, our sales will direct you to a distributor. Ask for the TIVL-36-175. It is 36 Volts @ 4.8 amps. It is constructed on an international bobbin with terminals. Or try the 23V430. It can deliver 6 amps. Please tell them that Bill Derks contacted you over the net.

Thanks. If you have any future questions, just E~mail me.

>can something similar be done to li-ion batt?

I don't think I'd try it. Li-ion batteries normally have some sort of electronics that monitors the voltage across each cell. If you let the voltage get too low, the battery permanently loses capacity. If it gets too high, you may start getting metallic lithium plating out inside the battery. This is a fire and explosion hazard!

So trying to "zap" a lithium battery has two potential problems. You'll probably really zap the charging electronics that are likely in the pack with the battery, and there is a chance of creating a real hazard with the cells themselves.

3239. Re: Mercury-wetted relay

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-23 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <1998032302160000.VAA08375@ladder01.news.aol.com>
Source record: 84601

Mercury wetted relays have some very desirable characteristics:

1) Very high speed operation (a few milliseconds, max)
2) No contact bounce
3) Very long life for a mechanical device (1 billion operations if contacts operated within ratings)
4) Low power consumption
5) Usually supplied in hermetically sealed, plug-in cases.
6) Can be made with very good insulation between coil and contacts

And some undesirable ones:

1) Relatively expensive
2) Must be operated "right side up"
3) Mercury freezes at very low temperatures (-10 F?)
4) Contact rating is limited and must not be exceeded.

In amateur applications, they are useful in CW and RTTY keying circuits because they can be set up to key almost anything.

3240. Help with circuits?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-23 00:00:00 UTC
From: n1bug@mint.net
Message-ID: <3515ca8c.43874254@news.mint.net>
Source record: 84602

This is a little difficult to explain.

Long story made shorter: I need a couple of circuits for a repeater project and I'm running short of time. I've checked every book on my shelves and all the local libraries... no help. I was hoping maybe somebody is bored and would kindly elmer me a little here. I'm ready to learn!

Circuit 1:
I have "board A" which is a control circuit with an output that shorts to ground on transmit (it uses an IRL511 FET for this). I have a source of 13v and a source of 10v, and a transmitter that requires BOTH of these to be switched (ON for transmit). The switching must be done in the positive 13v and 10v leads to the transmitter, as the negative is on chassis ground and needs to stay there.

Here is what I *thought* would work:

Coming out of the fet on "board A", through a resistor into the base of a PNP transistor... emitter of that transistor going to the +13v supply, and collector to the +13v input on the transmitter. Then, an NPN transistor, its base connected to the collector of the PNP device, collector to the +10v supply, emitter to the +10v input on the transmitter. It doesn't seem to work. Faulty logic? Faulty components? Bad luck?

I specifically want to do this with bipolars if possible. I do NOT, under any circumstances, want to use a relay (which is what I have in there now, but I want to get rid of it!). I guess I could use optoisolators, but isn't there a SIMPLE way to do this with the transistors?? Feel free to laugh if I have really done something stupid here! Just tell me WHAT you're laughing about so I can learn from it, please!

Any advice on how to switch these two circuits using the output of "board A" would be much appreciated.

Circuit 2:
This is a bit easier to explain. I have a small voltage coming out of a high impedance circuit in the receiver, which I want to be able to meter (2nd limiter voltage). The meter I have in there is a 100 uA movement, and I can only get a small deflection when the limiter is fully saturated (not to mention how much that meter may be loading down the limiter!).

I was hoping to use an op amp to fix this problem... sort of a DC amplifier... should be high impedance input and have WAY more than

enough output, right? I have a couple hundred TL071's and some other op amps around, but I haven't been able to find a circuit design example for what I want to do. Any help out there? As part of this circuit I would need some way to adjust the gain so that full scale deflection is just reached at limiter saturation.

That's all the incredibly dumb questions I have today, folks...

Paul

Ham equipment for sale.....

600W Peak, 400W continuous output, wideband, class A linear amplifier designed for 15-150 MHz. Average drive required for full output is only 15W. Single drawer unit includes Kilovac relay COR switching, adjustable time delay, and accessory switching. Amp utilizes a wideband splitter/combiner combo, auto bias switching, thermal protection, and uses MOSFET transistors. Amp delivers extremely clean signal and is overdesigned to provide 100% duty cycle at 400W output. Requires 28VDC @ 70A peaks for a power source. Asking $500 or best offer. I would also consider a trade for a solid state HF transceiver.

Pride 250W SSB / 100W AM/FM output HF (160-10M) solid state base amplifier with power supply, receive preamp, status LED's, etc. Uses 12W to drive. $150.

250W minimum output, all mode 80M-6M solid state base amplifier with built in power supply. 15W drives it to full output. It includes a variable drive attenuator. $250 O.B.O.

250W PEP / 100W continuous output 6M amplifier. Solid state base design with built in current limiting power supply. Includes meter, ALC/VSWR protection, receive preamp, and only requires 2W of drive for full output. Asking $150 O.B.O.

Gonset GSB-100 transmitter (80-10M). Works great, cosmetically fine. Has AM; PM; SSB; & CW modes. I will even throw in a second unit that's good for spare parts. Due to the weight of this item, I will not ship. $150 O.B.O.

If interested, please reply via E-mail at wizard@eskimo.com

I've never lived in Florida - or anyplace south of Philadelphia. I got this callsign twenty years ago when I lived in New York State, halfway between Rochester and Syracuse, working in the signal department of a major freight railroad. Equipment for the RR signal system is installed in unheated metal equipment shelters. I still remember one night when a particular piece of electronic equipment (a hot bearing detector) failed because a mercury wetted relay froze up. I confirmed this by unplugging the relay and warming it up inside the car. Before warming , you couldn't hear the mercury sloshing around inside the relay when it was shaken. Afterwards, you could hear the mercury, and when the relay was replaced, the equipment worked perfectly for several hours, at which time the warming was repeated. The temperature at this time was somewhere below - 10 F. Maybe the mercury didn't actually freeze, but it was slushy enough that the relay didn't work. I don't know how cold it actually got that night, but the coldest I've ever been outside working was -36 F. Eventually the relay was replaced, because failure above -40 was considered unacceptable. All wayside equipment was expected to work down to -40 - at least.

3250. Motorola MT-1000 Out of band programming

Date: 1998-03-23 00:00:00 UTC
From: bsher19577@aol.com
Message-ID: <1998032311583201.GAA06369@ladder01.news.aol.com>
Source record: 84612

Can anyone help me with the programming of a Motorola MT-1000 on 42-50mhz split. I want to program it for 6 meter ham band. I have tried hex editing the archive file in mrss but then the radio will not power up until it is returned to in band programming. Any help would be appreciated.

Please e-mail your responses or post them to this group.

Thanks
Barry

Go the the hobby shop or trophy shop and get a small wooden pedestal.
Stain glossy and mount a tube on it and attach polished brass plate with
your call letters on it. Take it to a hamfest and I guarantee they will
pay you $2.00 per tube to build a paper weight like yours! Used to put
these together from old WWII tubes and sell them like hot cakes!

>dielectric...Jordan...

IMO all single-wire HV connectors such as the Millen series are unsafe. They do absolutely nothing to prevent the B-minus and/or safety ground being removed while the B+ is still connected, making the whole chassis dangerously 'live'.

HV systems should be designed and operated such that it needs AT LEAST TWO separate things to go wrong before it becomes dangerous. With single-wire HV connector such as the Millen, it only needs one fault and you're dead.

As a minimum, HV connectors ought to be coaxial with a grounded shield, and should not mate with any other coax connectors in the shack. Using regular UHF connectors for HV is inviting a very nasty accident!

Also, when you join two HV connectors they should connect ground WELL BEFORE they connect B+. Only specialized HV connectors do this well. Connectors designed for RF such as BNC or TNC can sometimes connect ground at about the same time as B+ if they are not assembled well. The UHF series practically guarantees that ground will only be connected after the B+!

The two best coaxial HV connector series for amateur radio use are MHV and SHV. You can get them from surplus outlets, and Radiall manufacture both series in the USA. With RG58 cable these will easily carry a few amperes of DC, which is as much as a legal-limit amplifier needs.

The MHV series look like a stretched BNC. Even better - if you can find them - are the SHV series which have the BNC locking ring but the inner connector is reversed between plug and socket (male pin in the socket, female in the plug with the locking ring). Nothing else can possibly mate with them, and the inner connector on both parts is deep inside the

insulator. SHV also provide the surest grounding as the connectors are being mated or disconnected.

Message-ID: <3516C532.77E9@hagagymnasiet.norrkoping.se>
Source record: 84619

I am using mercury-wetted relays as RF input relays in HF linear amplifiers with full-break-in feature. They are fast and quiet and inexpensive in the local surplus store. The heavy-duty type (300 Volt 5 Amp) is good enough for 100 Watt from my exciter. I tried them as output relays too, but they didn't stand more than 300-400 Watts before they were destroyed. They don't handle RF as well as DC and there was noticeble difference in power handling between 1,8 and 28 MHz.

Darn SPAM!
Reply to bob will get here
reply to nobody won't.
Thanks.

This radio is in good condition.

I do not have an external mixer: Sage 1026H
or signal combiner (hybrid).

WR250B 1 1
sn 108

7.5MHz to greater than 100GHz
Slide rule dial directly calibrated to 22.5GHz (10 bands)
All SS except for CRT and cavity oscillator (believe I have a spare
osc. tube too which I'll throw in for free)
IF bandwidths of 0.5, 1, and 5 MHz
Tracks
Scans

It's your basic early 70's Surviellence or Range RX and was marketed as
such.

Radio is in good condition. Manual is excellent.

Best offer over $200 by months end or swap for interesting HF/SW radio.

>Bill, gm8apx, qthr
>Edinburgh, Scotland, near England

I haven't followed much of this thread, so may have missed some important explanation. But a light bulb of any type makes a poor substitute for a fuse. A bulb acts a lot like a constant-current source, with a high dynamic impedance. That is, if it's in series with a load and the load resistance decreases, the voltage at the load will drop almost in proportion. This would imitate a battery very near its end of life, when its internal resistance has gone way up. It wouldn't surprise me at all if a rig would oscillate or "motorboat" if a bulb were placed in series with the battery supply -- regardless of the battery type.

My measurements of Polaroid batteries shows a capacity of about 75 mA-h. (Compare this to 500-800 mA-h for AA size cells.) Although they should be able to put out enough current for an HT, and have a low enough impedance, they wouldn't last very long on each charge. However, you might be able to increase the capacity by using batteries in parallel. (Although this generally works with lead-acid cells or batteries, don't try it with NiCds or other recharageable battery types.)

I'm reminded of a story told to me by a fellow who used to service hi-fi amplifiers (in the pre-stereo days). The customer had used regular mains outlets for his speaker wiring as an inexpensive way to allow him to move his speaker from one place to another, and had fitted the speaker cord with a mains plug for connecting to the speaker outlets. After servicing the hi-fi, the repairman (from whom I heard the story) plugged the large, expensive speaker back in. The moment he heard the tremendously monstrous hum, he knew what had happened, but it was too late. By the time he lunged for the plug and pulled it, the speaker was dead. (Although some modern speakers might take it for a short while, the 1600 or so watts that one got was far too much for it.)

Take Ian's advice!

Good stock on E810F Mullard valves. These are fully equivalent to the
USA 7788 type. This is a UHF wideband pentode with a transconductance
of 50mA/V!!!
Well suitable for both audio and RF. The valves are new and in
original boxes.
NOK 214.60 each or about US$ 28.- each

3265. Re: Tandy 49.8 "Walkie-talkie" to 6 metres?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-23 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.980323142902.7227B-100000@Ocean.CAM.ORG>
Source record: 84627

Superregens don't lock onto a signal; it's just that they are so
wide in bandwidth that exact tuning is not important. There was a tie
when you'd see simple VHF receivers that used what amounted to a converter
ahead of a superregenerative receiver. I was looking at one of those
articles the other day, and even down around 10MHz the bandwidth of
the detector was hardly narrow.

I thought that those license free walkie-talkies did have standards,
and they had to be crystal controlled or at least the equivalent
in stability. Even when these sort of walkie talkies were common
at 27MHz, they were crystal controlled. All the ones I've seen have
been on the same frequency. I imagine that it's the same at 49MHz;
while there is more than one channel available, they will tend to
all be on one frequency.

If they are like the 27MHz units, the transmitter probably isn't
much more than a modulated oscillator. So there might be incidental
FM, which wouldn't be noticed in the wide bandwidth of a superregen,
but would be noticed in a stable narrow receiver.

(follow-up)

Unfortunately it looks like the MC10EL33 is a dynamic device like the MC12074. I just received a few parts from Newark, and while it doesn't self-oscillate in the absence of a valid input signal, it does start to miss cycles below about 10-20 MHz unless you boost the input amplitude to compensate for the LF rolloff. At 100+ MHz, sensitivity is around -15 dBm (with a 1K bias resistor to the active clock input, and the other one tied directly to vbb). By the time you get to 20 MHz, you need -10 dBm for a stable output. At 10 MHz you need around 0 dBm, and below about 2 MHz, the divider doesn't work properly with any input amplitude.

So I guess it's time to plan on adding a range switch to the counter.
Bummer.

Usually you have 0.1-1 ohm resistor between negative side of psu to
chassisground. Bearing in mind G3SEK's note about implications, I would
use C-connectors - since they are odd type for normal RF applications.
You might mix up with other connectors if you use BNC, SO239/PL259, N or
similar. I use TNC-connectors for voltage to antenna
relalys/preamplifiers. I often wonder which application the C-connectors
might have in my shack, they are inexpensive at rallies, but they laying
around and I never found another application(?)

I certainly have never had trouble with slow rise times with TTL (are
you thinking of CMOS?) but you win the prize for figuring out how to
make this ECL part work!

A sine wave from my 8640B does just what I mentioned above, becoming
unusable below a couple MHz.

A square wave from my function generator, run through an overdriven
MMIC, works fine down to my required minimum of 50 kHz.

Doh!

>
> If you are feeding 0 dBm sine wave into 50 ohms (for which nominal
> impedance level many ECL parts are designed, that is only about 220

> nice, sharp square wave.

For whatever reason, the input stages of this chip are quite sensitive. It's rated for an input swing of 150 mV but it seems to toggle reliably at a little more than 1/10 that much, if you give it the kind of waveform it likes to see.

>
> As I said, I have not seen the specs for this particular device, but
> if it works in a similar way as normal ECL logic, no wonder you have
> problems if you are feeding it with sine wave or sloppy square wave.
>
> Paul OH3LWR

Sounds like that's the answer in this case. Running the signal through an overdriven buffer stage, or two, should do what I need.

I've never used ECL before apart from the MC12074 prescaler, and didn't know the family had a minimum edge-speed constraint. (The 12074 just oscillates if you don't give it a minimum input frequency of about 90 MHz). Figured that since it was made from DC-coupled linear stages, it would be happy with any signal that was reasonably noise-free. Unfortunately the Motorola data sheet for the 10EL33 is rather empty of content, revealing little beyond the negative supply voltage and maximum toggle frequency for the part. So it's not much of an educational guide for the ECL neophyte. :(

Really appreciate the advice!

3281. Yaesu Ft 8100 R Freeband Mod Now Avalible

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-23 00:00:00 UTC
From: _Mac_ <mcgyv@hotmail.com>
Message-ID: <35161A6C.3E8C@hotmail.com>
Source record: 84698

Software mods for the FT8100 ver:1.00 date 03/98

Ingra-Beton@t-online.de and mcgyv@hotmail.com

The FT8100 uses a little bit differend aproach for
the up/download. It is not possible to change the
Country Codes via Software. The firmware and EEPROM
is a little bit bigger so a secure check can be
done and if the Hardware configuration won't match,
the FT8100 is refusing to accept the data file.

There must be anyway either a Secret menu or at
least 3 Jumpers for setting the country code.

But as usually Software rules, so it is possible
to move the lower and upper limits for RX and TX.

With this way the FT8100 will FULL OPEN and can
be used on all Frequencies for RX and TX where
the Hardware will allow it.

You will get a FREEBAND mod and the good thing
is that the ARS will still work.

To make the mod you will need the ADMS 2D Software
and a HEX editor or just visit:

http://ww2.sd.cybernex.net/~mcgyv/

where you can download the allready patched .RDF file
It does not matter what Hardware mod you have (or have
done) or for witch country your FT8100 is configured.

Technicaly you are only moving the limits for
the Frequecny dealing.

Make a .RDF file and edit it with a HEX editor.

The values on the following addresses are defining
the lower and upper limits for RX and TX on the
VHF and UHF bands

Band Lower limit adr Upper Limit adr
==========
VHF RX 0A66 and 0B2A 0A6A and 0B2E
UHF RX 0A76 and 0B8F 0A7A and 0B93

VHF TX 0A6E 0A72
UHF TX 0A7E 0A82

Value example:

VHF RX 0050 0280
UHF RX 0280 0650
VHF TX 0050 0280
UHF TX 0280 0650

If you insert the values from the example in the
abouve addresses, the FT8100 will be opened for
RX and TX from 50-280MHz and 280-650MHz.

After modification the following results are
mesured.

RESULTS:
Upload: Free.rdf & Stock.tpl (see web page:
http://ww2.sd.cybernex.net/~mcgyv/)

VHF:

RX 50.00 to 109.995 TX red light active on 80.00 to 109 (not
sure if it really TX'ing)
Also all the digits "X" are flashing.
Example: 50.XX to 109.XX

RX 110.000 to 136.995 Same as above, but has the "AM"
displayed.Also all the digits "X" are
flashing.But this is only between
110.XX to 111.XX twoards the 110.8 MHZ
range, the
flashing seems to slow down in "pulse"
(notblinking as fast.)

RX 137.00 to 210.630 Does TX but not tested for RX on a scanner.

RX 201.630 the .630 starts to flash. The 201. does not flash.

RX from 201.63 to 205.995 flashes, however still unknown if it is true
TX.

RX 206.00 to 280.00 TX but unknown if it is true TX

==========

UHF:

RX 280.000 to 550.000 TX light is on, but need to chek for true
TX

RX 551.00 to 650.000 TX light is on, but need to chek for true
TX, also 551.XXXto 650.XXX blinks

RX 750 to 869.00 NO TX

When at 750.00 , if you cycle backwards...you end up at 550.00...rotate
forware to get to the 600.00MHZ band

RX 894.00 to 1330.00 No TX

==========
Remember, the Mars/cap mod is not required to do this mod.

This mod is a product of the intercontinental
digital cooperation between:

Mazedonia - Ingra-Beton@t-online.de
USA - mcgyv@hotmail.com

East and West, together on the Net.

3282. Adding FM capability to HF rig

From: allenrolf@webtv.net
Message-ID: <6f8fvb$75k$1@newsd-154.iap.bryant.webtv.net>
Source record: 84555

Back in those old days of tubes, hetrodyning was only used in receivers .. heaven forbid, a hetrodyne VFO? Shades of the ARRL Hanbook!

Normally, you would build a basic tunable VFO from 3.5 to 4 mhz, then double to 40, double again to 20, or triple to 15, and double 20 to 10 ... anyway you can figure that part out. A good stand-alone all band VFO had a number of multiplier stages and a buffer, for sure.

Go to your local library and look up the ARRL Hanbooks before 1960 and you will see some classic VFO tube designs. You will probably be amazed at the tool and die work that went into these large boxes with neat sci-fi knobs and dials!

On of the biggies of the period was building stability into a VFO. Tubes took the case from RT to several degrees below finger-burning and as everything expanded the drift became terrific. Everything was built solid as brick and NPO's were used all over the place in tuned circuits!

One of the best VFO's of the time were the 3.5 to 4 mhz BC command transmitters that are still around for $20-30. (Is someone still making them in their basement?) You would take one of these and pull the VFO signal out to drive a ham transmitter. One scheme (QST about 1956) was to saw the BC cabinet, about the size of a shoebox, in half with a hack-saw and use only the front VFO portion. The back half with PA was thrown in the junk box. Only problem, after you got through with the project you had one of the best harmonic generators ever built! That little VFO barefooted would wipe out TV reception for miles!

Crystals back then were very available from WWII surplus and there were dozens of ways to move a crystal frequency, if only a few Khz. First you could grind the quartz slab thinner with Pepsodent tooth powder on a piece of plate glass. (a figure 8 grinding pattern with the fore-finger was carefully explained) You could also "lead" the xtal down by marking it with a lead pencil.

One novel approach was a crystal in it's case with a little pressure fixture controlled from the front panel to change the pressure on the quartz slab. It was really a rube-golberg approach. Also there were schemes to push or pull a xtal's frequency with shunt and series capacitors.

In most cases, poorer hams just had a cigar box full of surplus crystals and pluged them in and out. This was known as an "armstrong VFO!"

If you really want an "old fashioned" tube VFO those are some of the choices.

But, gosh, a hetrodyne tube VFO? Maybe, but I sure don't remember any
until after SSB became popular in the early '70's!

ANother way would be to use the collins PTO(COSMOS), which
can be bought from fair radio sales for $45, and mix that
with a set of crystals for whatever ham band you want.

Just stick a 10 turn dial where the oldham coupler is,
and voila, you have very-very stable and low noise VFO.

Not really true. Virtually everything is readily available. Tubes,
sockets, resistors of any wattage you might like, etc. What you can't
find at Newark or Mouser or Tech America you can find at such places as
Fair Radio Sales, Surplus Sales of Nebraska, Antique Electronic Supply
and a host of others, including hamfests and ... by golly ... right here
on the internet. :-)

Lack of stability is the reason multiplier VFOs were abandoned. Whatever
the basic stability of the VFO at its fundamental, any drift was *multiplied*
by the doublers, triplers, etc. So if you started with a 3 MHz VFO with
200 Hz stability, by the time you multiplied it up to 10 meters it would
have a drift of 2 kHz. Not good. By hetrodyning with a crystal oscillator,
the stability on any band was the same as the stability of the fundamental.
Much better.

Using the hetrodyne method usually reduced the number of tubes needed
too. The crystal oscillator and mixer were usually combined in a single
tube, so you only needed two tubes to cover all HF bands.

Years ago, when 10M FM was sort of making a splash (HF rigs started to include FM capabilities, and there were one or two commercial amateur rigs for 10 FM), a local company had a kit to add FM to HF SSB rigs. It was terribly simple, and probably suffered as a result.

It used a simple oscillator and mixer to take the IF signal from the transceiver, it must have been after the first mixer (the rigs in those days had first IF's in the HF range), and converted it up to 2M, where you'd use your already existing rig as the FM IF strip. Kind of messy, but it was cheap.

On transmit, it was just a simple audio stage that tapped off the microphone jack of the SSB rig, and frequency modulated something. It was a long time ago, and I can't remember what. Something that already existed, like an FSK input, but that can't be because not all the rigs had them.

Anyway, transmitting FM is fairly easy. If you can't figure out something in the VFO where you can introduce an audio signal to FM it, then you'd add a varicap in a suitable place. You'd have to look over the schematic.

Receiving FM is harder, since many rigs don't have a wide filter. Even an AM filter (and those sure weren't standard on a 820) would be on the narrow side. Yet right after the first mixer is a narrow filter, in keeping with good receiver design practices. You'd have to tap off the output of the first mixer, and add an IF strip that included filtering, amplification, limiting and detection.

If the first IF happens to be at 10.7MHz, an easy way would be to buy one of the superhet 49MHz walkie talkies, and take the IF from the SSB rig to the 10.7Mhz IF of the walkie talkie. If the first IF is not 10.7MHz, then you'd need to add a mixer and oscillator between the SSB rig and the walkie talkie's IF strip. The walkie talkies convert to 10.7MHz and then 455KHz, so one could go directly to 455KHz, but that won't work if the signal goes through a narrow

filter in the SSB rig before reaching 455KHZ.

Hi, Walt --

Re: QSY'ing, I couldn't agree with you more, but the problem is, these primates don't read the newsgroups they cross-post to.

I did not add the follow-ups to the thread, but I did leave them in place for my reply in hopes that the other participants in the thread would get the hint. I then set the follow-ups to rec.radio.amateur.misc, which is the only group even vaguely suited for this type of traffic. You're the one who brought it back to r.r.a.h, so pse QSY yourself. :-)

The idea, at least at first, was that my original reply would have been the last ANY of the other groups would see of the thread.

obviously UHF connectors withstand much higher DC-voltages, but I would
never use UHF connectors for HT since much equipment has UHF connectors
for RF port.

RG8A/U (RG213?) has maximum operation voltage 4kV RMS, it fits the
proposed C-connectors, 'HV-cable' may not.

I built few, the last was PW Meon transverter, chose to use 14-14.5MHz
as IF since second harmonic from 10m band is too close to 6m band

The MHV connector should be a special HV BNC type. It can take
3000 VDC, and is readily available (at least here in Norway) although
somewhat expensive, US$ 8 - 12
How about the N type. Anyone know how mych this can take?
What is the best connector to use for voltages up to 3 - 3.5 KV?

Fellow ham radio operators
I did not post this crap. But I know who did and I don't think that you
or I will be seeing any more of it. Mr James Obrien KD4CDB is no longer
with mindspring. THis is a newsgroup and I thought that I would spead
the word so we could all rejoice in Mr Obrien's misfortune. I hope now
that the real idoit is gone the News group will return to normal.
Again Mr Obraindead is no longer with mindspring.com. Call Harry Smoak's
office and thank him.

Get a Ten-tec. $95.00 kit or about $150.00 wired. Have one it works great. Has built in pre amp and a switch to switch in in, or out of the line. Drive is 1-10 watts input with 8 watts out all modes. Built in t/r switching with pin diodes. Using one here with a FT-1000D.

Mike

3308. 12volt power for Toshiba laptop?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-24 00:00:00 UTC
From: Ken Harris <kjh@shoreline-studios.com>
Message-ID: <351846E7.41C6@shoreline-studios.com>
Source record: 84575
Cross-posted to: rec.radio.amateur.homebrew,comp.sys.laptops

I have a Toshiba laptop (425CDT) that has a "built in"
AC adaptor. I want to run it on 12volt power. I know I can
run an inverter on 12v to make 110vac and then send that to
the laptop, but that will be too inefficient.

Is is possible to "hack" a 12 volt supply into this
machine?

I have a new, unused Mitsubishi M57737 30W VHF FM Power Module for sale.

It's usable from 138-152 Mhz and puts out 30W for 0.2W input and 12.5V DC in.
The price at RF Parts is $43.60 plus shipping. I will ship it to you for $30.
These are/were used in popular amateur FM transceivers. If you need one contact me via direct email.

If it were me personally, I wouldn't even touch it. I would deal with inefficient before I dealt with experimenting on anything worth as much as a newer laptop. If this is just a junker, go ahead and try to convert.

This will void any and all service agreements you may have on the laptop, but If it comes with an AC adapter, it's probably turning it into both a 12V and a 5V source, and attaching it to the rest of the machine from there. If you were to open this up and isolate an AC adapter circuit, which I would guess Toshiba has already done for you, you could probably gut it out and hook it up to a 12/5 power supply. It's not straight 12, but at least it's DC. There's a good possibility that the adapter is putting out 3.3V or something like that, so I would get out the multimeter and measure the adapter output. (Once it's isolated of course. Don't just start sticking meters onto the bare board)

Re 813 Amps...

John, there were a series of 813 amps in the ARRL handbook in the early 60's as I recall. I'll try to find a better reference. Anyone else??

THe 813 is a very good linear amp. I have a homebrew rig based on parts of an ART-13 WWII aircraft transmitter (made by Collins). It's unused these days, but I won't junk it; it's worth the nostalgia...

One obvious question that I haven't seen anyone asking, are you
feeding it with a sine on square wave ?

I haven't seen the specs for this device, but if it is similar to
normal ECL logic, they can be picky about rise and fall times. You may
need to add a Schmidt trigger or saturating amplifier to get short
rise and fall times. A 100 MHz sine wave has a rise time of 3 ns, but
at 10 MHz, it is 30 ns, which is quite a lot even for TTL (especially
flip-flops), not to mention ECL.

If you are feeding 0 dBm sine wave into 50 ohms (for which nominal
impedance level many ECL parts are designed, that is only about 220
mVrms or 630 mVpp, which is a bit low for many ECL parts even with
nice, sharp square wave.

As I said, I have not seen the specs for this particular device, but
if it works in a similar way as normal ECL logic, no wonder you have
problems if you are feeding it with sine wave or sloppy square wave.

Source record: 84646

Lets not forget the obvious. UHF and BNC connectors are RATED at 500 volts peak maximum, making them unsuitable for HV connections. RG-58 is rated at 1900 vrms, so it would take only 2686 vdc, etc. It will take more if properly terminated, but why push things past the limit. HV cable can be bought in an auto supply store as spark plug wire and the non carbon, real wire stuff can still be found. Add a braided shield over it and an excellent HV cable can be made.

George, W2VJN

3322. Microwave ovens for ...

Newsgroup: rec.radio.amateur.homebrew

I've thrown this out several times before, but I recall a Central States VHF talk by Joe Reisert, W1JR, some years ago in which he discussed three active VHFers doing work with magnetrons: two died of brain tumors and the third swore off forever. Joe would have the story.

Also, in a book, The Machine that changed the world....., about the MIT Radiation Lab, the magnetron was invented in England and brought to the US for development at a very grim time for the English. The discussion about it's development is both humerous and educational.

I don't mean to split hairs...but ...a given device will draw less
current when powered from a 220V supply than when it is powered from a
110V supply. Also the receptacles for 220 are round , not spade so you
can't really plug in the wrong cord in.
Just my $0.02 :)

Whoever "designed" the MHV did only half the job, because an MHV socket
WILL accept an ordinary BNC plug - and that's dangerous!

SHV connectors are much better designed, and will not accept anything
else but another SHV connector.

Hi,

I have some CV 511 valves for sale. This is the same as 6V6GT. The valves are in gvt. white boxes. They have black base, the glassbulb is very dark. The coding is KB/FE 6V6GT. I am pretty sure they are made by Mullard. As far as I know the valves are new old stock - unused. Anyone interested? I have 8 pcs.

www.surplussales.com has a 9 to 38 4kv and a 13 to 400 1kv. Also some vacuum variables to 50 kv.

BNC connectors are used for signal generators, frequency counters, deviation meters, exciters, transverters, converters, video equipment and several other accessories. Before choosing BNC (and N-type) connectors for other than RF purposes please read W7EL, Roy's note:

QUOTE:
I'm reminded of a story told to me by a fellow who used to service hi-fi

amplifiers (in the pre-stereo days). The customer had used regular mains

outlets for his speaker wiring as an inexpensive way to allow him to move his speaker from one place to another, and had fitted the speaker cord with a mains plug for connecting to the speaker outlets. After servicing the hi-fi, the repairman (from whom I heard the story) plugged the large, expensive speaker back in. The moment he heard the tremendously monstrous hum, he knew what had happened, but it was too late. By the time he lunged for the plug and pulled it, the speaker was dead. (Although some modern speakers might take it for a short while, the 1600 or so watts that one got was far too much for it.)

Take Ian's advice!

Roy Lewallen, W7EL

You would only be able to use it on 10 Meters. Kenwood built an optional FM board for the TS-430. They may be hard to find now, but one of those might be practical to put in the 820.

Honestly, I wouldn't mess up the 820 trying to do it. Good Luck.

Message-ID: <01bd58cc$00b55b60$0d0101c6@spider>
Source record: 84465

I'm looking for a QRP CW transmitter for 80, 40, and possibly 20M. It can be homebrew, if clean and fully functional, or some form of kit or commercial product.

It needs to be pre-built and fully working, since I don't do much construction anymore, and VFO tunable, so I won't have to rely on rocks. Power level between 2-10W is desirable.

I'm going to use an outboard receiver, so the rig doesn't need one, but I'll consider most anything, if the price is right. After a lapse of 15 years, I'm going to get my ticket back and spend all my time on the CW bands. After listening to some of the hooraw on 3950 and 14300, I've decided my phone days are over.

Please respond with a complete description of the rig, condition, features, power requirements, and price shipped to 75010.

I decided to post here first, because I have a fondness for homebuilt rigs. Virtually all my Novice gear was homebrew, and it was a lot of fun. Although I've got a table full of goodcommercial receivers, I want my xmtr to be homemade.

Re: Connectors and Safety...

This reminds me of a fundamental rule my dad, N1UF had: Always have a heavy-duty RF choke across the antenna input connector (usually on a T-R relay, or rotary switch input). This was for DC Faults typically within an amplifier: primarily the DC Blocking capacitor shorting.

This DC short path to ground for your station would have 3 benefits:

-- Protection against amplifier fault putting HV on antenna / cables
-- Protection against misconnection of no-no coax connector used for HV
-- Drain for static buildup on antennas.

Just one more backup protection against brain faults...

I've got a couple of 850 watt microwave oven transformers here; however they normally deliver 850 watts of RF AFTER a voltage doubling rectifier-capacitor circuit. The magnetron actually sits across the rectifier. No wonder the waveform is 'orrible!

They also have a heater winding - only 2 or 3 V but many A.

Possibly more appropriate is an electronic (valve) organ transformer: 400-0-400 V at 400 mA, 6.8 (yes 6.8!) V 5 A, and another winding for an appropriate valve rectifier.

If you are interested in either, the cost of carriage would be the problem especially as you might decide the item is not suitable.

I might be driving as far as Annan (near Gretna Green) on 6th April; and probably MUCH further south during the 2 weeks commencing 10th May.

I also have the matching smoothing (possibly modulating?) choke: 10 H at 400 mA. Likewise VERY heavy.

Details only if you are interested as they are in the inevitable awkward place in the roof space! (I would have known if they had fallen through.....)

NO need to reply unless you would like to meet or arrange a handover.

What are the best SSB CB radios to attempt this conversion? I am perusing the 1978 ARRL handbook, which describes a transverter for 10 to 6, and the 11 to 6 idea popped into my head. Where are some plans for such a conversion, and do they work, and how well(badly) do they work?

No you don't. I can receive it with 10 feet of wire, in New Jersey. I'm
using the 'lowfer' preamp that's been described on the web (forget the URL,
but if you're interested I'll look it up) plus some other circuitry that
is definitely classified as "experimental." But I can receive WWVB,
although light dimmers are proving to be a problem.

That conversion sure sounds like a neat idea, but I have not seen anything on doing that. I suspect that if it were feasable there would have been quite a few articles about how to do it. Making the rf conversion is probably not very difficult. Having an output on 6 meters with the resulting CB channel spacing would not be a very practical thing since sidebanders don't usually think in terms of "channels" with the exception of the monitoring frequency.

Good luck on your quest. If you find something that works - you might really have something good. Walter

If you go this route, keep in mind the 2nd harmonic of your 10 m
transmitter, which will almost certainly fall in the passband of your
6 m transmit amplifiers.

You may be better off choosing a different IF and/or doing the
transmit conversion twice.

Congrats on the new callsign.

I found a source of NICAD fast chargers for $4 to $12 apiece. Now the problem- they're 12 volt, and I need to drop 'em down to 7.2v for my particular application. They're manufactured by a company called Celltek, and were originally designed to charge cell-phone batteries in 45 min. No, I don't want to charge my handheld QUITE that fast either! The dilemma- I can't figure out what they're using to regulate the voltage! There's a 5v precision regulator inside, but that just supplies the IC controller. The IC controller doesn't appear in my NTE cross-reference, so I have no idea what the pinout is. If I did, I think it would be a simple matter to change a resistor or something to pre-set the charging voltage to charge a 7.2v handheld battery, and then limit the current with a resistor to 150mA. Maybe it's not that easy- I don't know. But instead of spending $80 on an Alinco charger- why not use this one if I can get it to work? So- I guess my real question is- are any of you familiar with the Celltek charger? How about a schematic- anybody got one? Thanks, -Web in Myrtle Beach, SC

It sounds like the easiest route in fact. Probably, you can get by with changing the crystal in the transverter, and doing a bit of retuning. CB is only 1 MHz lower than 28MHz afterall.

It has the advantage over moving the CB set to 10M because you;ll have to track down information about the CB set, and then fiddle inside it. If you are building the transverter, you start with the schematic and it's probably less compact than the CB set.

Also, depending on the vintage of the CB set, converting the set to 10M may mean changing a bunch of crystals. The earlier synthesized rigs used to sets of crystals, which when mixed together gave all 23 channels. Eventually, all those crystals were done away with in favor of a PLL synthesizer.

Over they years, there have been quite a few articles published in the ham magazines, and there have been various schemes published to get around the 10KHz channel spacking, such as making the RIT active in transmit too, so it becomes a fine tuning control. It may not be as easy to use as an HF rig with a 500KHz tuning range on one main knob, but for six meters it probably matters less. Most of the time, you are listening, waiting for the band to open. No sense dedicating a fancier tig to that. If using the CB set means you get on six meters, that's better than not having someone else on that band.

ANother method to consider is to convert the CB set to 6Meters, and do away with the transverter. It requires more work, but might be worth the effort. There was once an article in 73 about this.

It made use of the fact that the VCO in the CB set is higher in frequency than the signal frequency. Instead of subtracting the 10.7MHz first if from the VCO, you add them, and you get a frequency slightly below the 6Meter band, which would have to be dealt with as you would a conversion to 10M. Then you redo the tuned circuits in the receiver and transmitter for 6Meters, and you have a 6meter rig in one package. I don't have the issue handy, but it was in the early to mid eighties in 73.

Michael

Hamtronics used to sell transverters for either 27-MHZ or 28-MHZ
exciters for 2 meter SSB, I don't recall if their 6 Meter transverters
had the same options.
About the only negative thing I can think of using 27 MHZ as the exciter
is the increased possibility of "bleed-through" when conditions are
really good. ZILLIONS more CB'ers than hams, and more of them high
powered too.
I preferred CB exciters for my transverter projects (though mine were
already converted to 10) mainly because years ago they alone offered
squelch on SSB, a fairly new concept for amateur rigs.

For Sale/ Trade: MOTOROLA B+ / Filament Transformer. OEM Part #: 25C 879211 1386252

If you are scratch building a power supply for a home built transmitter consider the following:

Size: 4.5 x 5 x 6 inches Steel Can - Bottom Flange mount - potted

Primary:
120VAC

Secondaries:
5.1 VAC
6.3 VAC
350 - 175 -0- 175 - 350 (ie: 700VAC center tapped with taps also for 350VAC)

This transformer is from a Motorola Base Station used in Public Service at Coffeyville, Kansas - belived to date from the mid 1960's (ref: last digits following part # shown.) Since the transformer is potted, I don't have access to measure the core cross sectional area, so I have no idea about the actual power rating of the transformer. But bear in mind that this transformer was built for CONTINUOUS COMMERCIAL DUTY and used in Police/ Fire dispatching and powered a base station transmitter.

Asking: $35 cash OR: trade for qty 10 (ten) 40673 dual gate mosfets OR: trade for qty 20 (twenty) NE612 ic's OR: 25 (twenty five) NE602 ic's. Please add shipping for 10 pounds. Anything over 10 pounds shipping weight, I will cover. Shipment will come from Wichita, Kansas 67219 Insurance extra.

These Celltek chargers are also available up here in Canada. I purchased a few of the ones designed for the Nokia 100 phone. They actually are designed to charge a 6v Nicad pack but will charge a 7.2v pack very nicely. There is no resistor mods required. They charge in a pulse mode - about 1/2 sec on then 1/2 sec off during which the voltage is checked. The charge is terminated when a slight drop in voltage is detected (the voltage of a nicad battery drops slightly when it heats at the end of the charge cycle). As is the conditioning circuit will discharge the pack to 5.0v but with a single resistor change (R11 on one of the versions - there are different PCBs used in these units - look for a 1% resistor with about 4.40K ohm) that can be raised to 6.0v for the 7.2 nominal pack.

I have modified one to charge my Kenwood TM-21 packs. The 600 maH PB-21H pack charges in 40 minutes in fast mode. The 200 maH pack charges in about 15 minutes. So far the packs are standing up just fine.

Lot of 10 NEW 14 volt grain of wheat light bulbs. Most rigs use 12
volters. These are 14 volters and put out just about the same amount
of light on 12 volts as the 12 volters do. They should last virtually
forever once replaced in your rig. This voltage is quite hard to find.
Mostly one ends up using 12 volters only to have to replace them again
in a short time. I found these at Dayton one year and bought up all
the guy had. Lot of 10 grain of wheat bulbs $15 postage paid to you.
Email me if interested. Also have some of these up on eBay if you want
to play the auction bidding game.

Hello--
Anoter application: DPDT mercury relays were used in "flying capacitor" front ends for industrial controls: the capacitor connected to the moving contacts, and two fixed contacts connected to the voltage being sampled. The remaining contacts fed and instrumentation amplifier or A/D convertor. Drive the coil at a few hundred hertz, and you created a sampled replica of whatever you were measuring-- isolated by the relay's breakdown voltage.

I saw one version of this system develop problems due to too-high switching frequency and mercury viscosity. A globule of mercury would form as the contact pulled away, and not fall clear of the contact's path on the return stroke. Like hitting a raw egg with a baseball bat, the mercury flew, creating a short-lived bridge to the unisolated voltage being sampled. The mercury ionized, allowing damaging levels of current to flow into the analog ciruitry.

Brad AA1IP

3385. 3-500Z Temperature?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-27 00:00:00 UTC
From: "Gary J. Ferdinand" <gferdinand@ipass.net>
Message-ID: <351BCBF5.E7EC75D@ipass.net>
Source record: 84497

What heat should I expect coming off of a 3-500Z? Conditions are: filament voltage (5V) and plate voltage (2500V) applied, biased to cutoff (no grid current and no plate current).

I just replaced a pair in my SB220. I don't really remember how much heat the Eimacs threw off, but these new, RF Parts (China) tubes after just a minute of running in standby get the plate caps so hot they sizzle when I hit one with a wet finger. Both tubes appear to have the plate caps above the boiling point of water. (Yes, after the plate voltage had bled off, with the unit unplugged.) I don't recall the Eimacs ever getting hot enough to burn skin, but the last time I was in the amp was about 20 years ago, when I last did a tube replacement, so I might not remember.

The glass envelope is also quite hot to the touch (top side) although all the pins underneath are pretty much at room temperature. Fan is working just fine. Plate and grid meters work just fine as does the amp as far as RF output is concerned. I'm just wondering whether that heat is normal.

Thanks in advance.

Gary W2CS/4

3386. 50.400 AM net

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-27 00:00:00 UTC
From: Dave Booth <booth@pactitle.com>
Message-ID: <351BD831.4C9A79EC@pactitle.com>
Source record: 84498

Hello all,

I have started a 50.400 AM net on Friday nights at 19:00 PDT.
It is run from Saugus Ca DM04rk by KC6WFS Dave Booth.

I'll be using a Gonset G-50 to a ARX-6.

If you are not sure if there is a net in your area check my net page.

http://www.geocities.com/Hollywood/5860/nets.html
I have a up to date list of 6m AM nets.

If you live in the local area please join in on the net.

Thanks,

Dave Booth KC6WFS DM04rk
http://www.geocities.com/Hollywood/5860/50am.html

I am interested in finding publications/papers on AM transmitters using PDM (or PWM) technology.

Can anyone recommend any engineering books or literature dealing with the subject of class D transmitters?

Thanks in advance,

Al

There is a nice G2DAF design for a pair of 813's. Uses some of the RF drive to develop the screen voltage. The only reference I can put my hands on appears in CQ March, 1966, page 26. However, this article discusses the application of the G2DAF design using a pair of 4-400 tetrodes.

You might contact Harris Corp. (217 222-8200) and see what they have. They
built more PDM transmitters than anyone else, I would suspect.

GE Ham News also had a nice design in the mid 50's. It was almost identical to the design used in the B&W LPA series of linears or B&W copied this design (not sure which).

Both used a pair of triode-connected, grounded-grid 813s, with a B&W 800 plate choke, a B&W 850 tank coil/band switch, that had an extra connection that would cut in/out an extra section on the plate tuning cap for easier tuning on the high bands. The design was for 80-10 meters. One thing you probably would want to add to that design is a cathode tuning network as in more modern designs (yes, I know 813's don't have cathodes but the idea is the same).

If you can get a copy of one of the BW manuals, you'll have not only a schematic, but the operating manual too, for your homebrew creation!

Try looking underneath the tables at swap fests -- this is where
the good (CHEAP) transformers hang out. Usually they are
attached to minicomputer hardware or other totally unwanted
junk. Keep in mind that you can play series-parallel and
buck/boost games with multiple transformers and with
multi-tap transformers.

Hint -- the last big commercial line printer I scrapped out
had a 15 amp, 36 volt transformer hidden deep in its guts.
So don't overlook the FREE junk like old Centronics printers.

'Nother hint -- old battery chargers generally use a center-tap
rectifier arrangement. Guess what the voltage across the complete
secondary has to be....and since these chargers usually have
dead rectifiers, they're given away or thrown away.

That's probably the cheapest way... Unless someone knows where to find 220 strips for $5 like those cheapy 110v strips do! The only 220v strips I've seen were in the racks for my Series/1. I don't know who started the thread and don't want to bother checking DejaNews, but I have an extra strip left over. I think it has either 6 or 8 outlets, maybe a 12 foot cord, and a circuit breaker. The outlets are the smaller ones, kinda like a regular 110v cord with the blades horizontal. It plugs into a different type of plug, though. Not the ones like my dryer has, but has all the blades arranged in a circular pattern. Or you could just run down to the local electrical supply store and grab some parts...

I do work work for Harris, but for the Electronic Systems Sector in Palm Bay,
FL; not the broadcast division in Illinois.

I realize that Harris makes broadcast equipment, but we have no communications
with them at all and do not share technology. We might as well be another
company (I guess that's the way big companies operate). We don't even design
with Harris Semiconductors and they're right across the street. They're too
expensive (they won't even give other divisions a price break).

Anyway, if anyone knows the titles of some books or papers, please let me
know. I already tried Harris and got nowhere.

Thanks, Al

Well, this isn't really a scam, or at least that much of one. I myself wouldn't shell out any money for the "secret plans". Popular Electronics and other such mags have printed similar circuits in many years gone by. All it involves is using the energy from an antenna (through a rectifier and filter, very simple) to power a simple low-current-draw receiver. The current drain cannot be too high since the available energy is not much, unless you live VERY close to a broadcast station. In such a case the available power probably wouldn't be enough to power a receiver selective enough to receive anything OTHER than the nearby station.

I have some Belden 9913 F. I have been attempting to put some N male connectors on it for several months now. The connectors are from Amphenol. Repeatedly, the connecotrs either come off, short out, or twist around and around. I have been following the ARRL antenna book to put them on. Amphenol did not give any instructions.
Thanks, N3YAR

It's not clear to me where your interests lie. If you're interested in seminal papers on PDM, you'll find several. The most readable are the patents by Hilmer Swanson of Harris, Forrest Cummings of Rockwell, and a second patent by Hilmer concerning polyphase pulse modulation.

If you're interested mostly in Class D, I'd have to differentiate whether you mean true Class D as used in most current solid-state transmitters or whether you mean Class D as it was used for many year in reference to a Class C amplifiers using third-harmonic resonators in the anode (and grid or cathode) to improve efficiency. If the later, the best single presentation was in "Radio Transmitters" by V.O. Stokes. If it's the former, there are a few texts about but reverse engineering any of the popular designs will give you a very good tutorial on what to do and what critical circuit elements aren't discussed in the basic texts.

I guess you'd have to say that the most widespread transmitter technology at this time, given the number of transmitters sold, would be a PWM modulator using a rep-rate of about 70 kHz supplying voltage to an H-bridge RF amplifier (using FET's) with a PEP output of about 1 kW.

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...
Down load a demo or just view the software main screen at our web

From: bilwoodson@aol.com
Message-ID: <1998032804372000.XAA13220@ladder03.news.aol.com>
Source record: 84523

FOR IMMEDIATE RELEASE

Software Development Tool Enhances DSKPlus Capabilities

Rochester, NY - Z-Domain Systems Development has officially announced the release of its DSP Expansion Board Plus (DSP-EBPlus). The board is intended to be used in conjunction with the Texas Instruments 'C54x DSKPlus. The DSP-EBPlus is designed to attach directly to the TI DSKPlus; with it, a software developer can enhance the capabilities of the DSKPlus to allow development and debug of sophisticated DSP code previously outside the scope of the DSKPlus's capabilities. Features include 128K of zero wait-state RAM, a bidirectional ASCII serial interface with software selectable baud rate, an LED and test point output latch, and software in C and assembly that demonstrates the ease of use of the board's features. This product is of special interest to companies and individuals developing communications, voice processing, and signal processing applications, because it allows companies to develop complex DSP software on a low-cost platform.

The DSP-EBPlus's ASCII serial interface is compatible with any RS-232 serial port. Its baud rate is software selectable from 2400 up to 115K baud. Software drivers are included to program and control the on-board UART. Embedded versions of familiar standard I/O routines such as printf, scanf, putchar, and getche are also included.

The 8-signal test point and LED output latch allow the output of important state information from the user's application that is running on the DSKPlus. The outputs to the LED latch are available via test points, to allow resolution of critical signal timing. Example code is provided that demonstrates these features as well.

The DSP Expansion Board Plus is available now starting at $99.00. Also available is the DSP Debug Board, which provides similar capabilities for the 'C5x DSK. Information requests and orders can be directed to Z-Domain's information and order line (1-800-743-1374), or via e-mail to info@z-domain.com, or by visiting the Z-Domain Systems Development, Inc. website at www.z-domain.com

Company Background

Z-Domain Systems Development was founded in May, 1996 to design, develop, and manufacture DSP-based wireless data communication, voice transmission,

and remote monitoring equipment. The 'C54x DSK Expansion Board
Plus is the second product in the DSP Debug Board line. Z-Domain Systems
Development is headquartered in Fairport, NY. For further information,

I assume this only receives AM stations and has no BFO. It wouldn't
happen to based on the fact that a transitor is a glorified diode?

Comparison 1 "P/N Junctions versus a PNP or NPN junctions."

Comparison 2 Hmmmm "Crystal Radio vs POWER SUCKER?"

I know I must sound sarcastic.... but seriously is there something
special about your power sucker or is it old technology in a fancy new
wrapper.

Let me know a little more and you might get my $5. But curiosity

Since you only need one to charge your HT you might build a simple LM-317 voltage regulator circuit that will drop the 12V to 7.2V +. One of these takes only a couple of resistors, a pot and a capacitor and is capable of up to 1 amp.

For my Siemens E566 receiver I wish to improve the product detector, it uses 1/2 12AU7/ECC82. I think the easiest circuit is to follow W5DA (73 june 79, page 33) What is grid exitation level? (5Vpp BFO with 0.5V IF level to the grid). Cathode resistor is 4.7k, with 10uF elko, anode load is 4k7, Anode current 0.62mA. Perhaps the cathode resistor is far too high, 2200 ohm is a suggested value.

Source record: 84536

Marty -
Back in the 1960's Popular Electronics ran plans for a 2 transistor radio which actually ran a loudspeaker with enough volume it could be heard across a room. The secret is that this is actually TWO rectifier circuits. The first one off the antenna runs a rectifier/capacitor to provide a couple of volts DC - IF YOU LIVE CLOSE TO A TV or RADIO BROADCAST ANTENNA. Essentially a wide bandwidth RF detector/filter. The second rectifier circuit is the familiar diode detector we all know and love. The amplifier can be anything you can put together that will drive a speaker from a couple of volts at low current draw. For $5 it would be worth it to see what Walt has come up with. I've looked for the original circuit for some 20 years, and have yet to find it. But, I do remember seeing it when I was in Jr. High School back in the 1960's. Probably works great - nice conversation piece to confuse your buddies. Go for it! Walt will thank you! You'll get your $5 of fun out of it!

I tries to reply via EMail - you weren't found at this add -
Your idea to build a 12V power supply using two 9V batteries in series could be implemented easily using a three terminal 12V regulator. If you have access to any linear data books or even on line you will find the hook up only involves 1 capacitor and the regulator itself.

Source record: 84540

I got hold of another one of these at a hamfest recently. It is quite similar to the other one I have. The old one is a type CV-1, catalog number 20-13-112 B8173. The new one is a CVN (harmonic neutralized,) catalog number 20-13-112 6D43. Both are 120VA.
My question: the old one regulates at about 118V, per the nameplate rating, but the new one regulates at about 122V, or about 3% high. Both line and load regulation seem to be normal at about 2%. Is this 122V output reasonable/within spec for these types? All voltage measurements were made with a true rms responding meter.
I'd appreciate any help you can offer. Thanks, 73, David K3KY

3431. Birectional wireless comm - Where to look?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-28 00:00:00 UTC
From: R Broens <rbro@worldonline.nl>
Message-ID: <6fjsfs$5a5$1@news.worldonline.nl>
Source record: 84541

Sorry if I'm in completely the wrong NG here, but maybe someone
here can point me in the right direction ?

My son would like to play games against friends who also have a
comp. but are too far away to connect with cabling. Unlike in the
USA (I think) or Australia, local phone rates over here in Holland
do add up quickly, so modem connection by phone is out.

What I thought of (and hope is already done somewhere) is using
4 CB transceivers for a bidirectional wireless connection. What I
probably need is a 'phone line faking' circuit so that I can use standard
33K6 modems with all their advanced errordetection/correction
at hand.

Circuitry mixing input to a TX on channel 32(CB transceiver I) and RC on
channel 34 (CB transceiver II) (say) would go to one modem, the other
party having a similar setup, with RC 32 / TX 34 of course (CB III &IV).

Now, the modems should be fooled into thinking thet heard a line avail.
signal when calling, and 'ringing' at the receiving end, etc.

Any pointers appreciated

Ruud

I think I saw the same article, though a few years later when someone gave me some back issues. I also recall an article in 1972, just after Popular Electronics merged with Electronic World, on the same topic.

I don't think there's anything particularly difficult about it. You have a "crystal" radio, but on the output of the diode, you put a bigger electrolytic capacitor, to remove the modulation content. You'd probably want the voltage boosting of a tuned circuit, but probably a broadly tuned circuit would allow you to pick up more RF.

A voltage doubling detector might make sense for the power supply detector.

For the af amplifier, you'd want something that uses low current and low voltage.

In recent years, there have been a return to the past in clocks (and maybe simple radios?) powered by two differing electrodes in a lemon. That kind of battery only supplies a small voltage with low current. If you came across something like that, and perhaps it might be more common, then that would show you a simple amplifier. Once you get that going, then you could switch to a RF powered power supply.

Michael

A quick and simple fix might be to place 4 nicads in tho charging circuit so the charger is still going at 12 volts. I'd just use 4 AA cells, maybe salvaged from an old dustbuster or something. Don't know how this will differ from charging in the "perfect" setup but should be an easy way to get you going.

What you need is a 2-wire to 4-wire network, commonly called a
phone line hybrid. Every phone has one, and you can buy them
separately from companies like Black Box. The modem goes on
the single pair, and the transmitter and receiver respectively go
on the other two pairs.

>Circuitry mixing input to a TX on channel 32(CB transceiver I) and RC on
>channel 34 (CB transceiver II) (say) would go to one modem, the other
>party having a similar setup, with RC 32 / TX 34 of course (CB III &IV).

This may be a problem. The circuit you want is called a duplexer. But
it is a tough job for the duplexer to isolate closely spaced frequencies.
You'll probably want to use channels as widely spaced from each other
as possible, IE I and 40, and use lower than normal transmit power too
in order to avoid "desensing" the local receiver with the local transmitter's
signals.

>Now, the modems should be fooled into thinking thet heard a line avail.
>signal when calling, and 'ringing' at the receiving end, etc.

You don't need ringing and the like. Just manually issue ATA to one
modem and ATO to the other. This will bring them online and ready
to train. The only trick is doing this inside the 30 second time out
window of the modems. They'll train and establish the connection
just as if they were on a phone line. Don't expect full speed performance,
however, because the radio channel doesn't have the SNR and phase
linearity of the typical phone line. Interference from other users may
also cause the modems to fall back, retrain, or drop the connection
completely. They aren't designed to deal with other signals on the
channel because a phone line is an exclusive channel, a CB radio
channel isn't.

You may want to rethink your approach and use simplex packet radio instead. That eliminates the duplexer and one of the radios at each end, and the packet modem and protocol is designed to work over radio and in the face of interference. It'll be slower on the CB channel than a phone line modem (a *lot* slower, max of about 9.6 kb half duplex), but it may still be a better choice. Check over in the newsgroup rec.radio.amateur.digital.misc for more info on packet.

(Note, I haven't commented on the legality of this setup. It would be illegal to do this under US CB regulations. It may be Ok in your country, but you should probably check to be sure.)

What is the model number? Some of the Unidens are PC programmable through the mic jack, while older ones require a propriatory prom burner from Uniden. (The PC programmable variety needs a propriatory interface box from the seriel port to mic jack)

From what I can recall, the PC software will not allow freqs below 450, and the prom burner is band selectable to START at 450 (Never tried programming a lower frequency.)

We see these Unidens from time to time in the shop I work in. Let me know the model number of the radio and I'll provide you with more info.

Heh, most commercial "450" rigs with crystals just require minimal
(sometimes tedious) alignment when recrystalled for 440.
The current programmable commercial radios don't even require that!
Just programming to your desired frequencies. About the only commercial
rigs "hard" to convert are those originally set up on the 470-512 MHZ
segment of the commercial UHF band. Most of these require circuit mods
to resonate within the 440 ham band.
Jim W5AOX
(having converted Motorolas Maxar, Mocom 70, Mitrek, Motrac, Motrans,
imports Midland, Uniden, and Standard commercial radios to 440)

Not necessarily.....

Working in land-mobile communications, there are few radios made today that are crystal controlled. Most all new radios are synthesized.

Be advised that all the Motorola radios above that you mention are OLD. Newer Motorola radios (Spectra, Visar, MaxTrac, MT1000, etc) have their firmware set so that it is impossible to program an out-of-band (ie ham) frequency. The exception seems to be some of Motorola's VHF gear that MAY allow programming down to 146mHz. PC programmable Motorola radios also do not respond too kindly to trying to trick their programming. It's fairly easy to corrupt the radio's firmware, and then the only remedy for repair is replacement of the CPU. Motorola parts for their current radios are a tad expensive, too.

Kenwood, fortunately, is the exception. In Kenwood's programing software, there is a "special tune" setting that allows for out of band programming. However, in any case, retuning of the preselector, RFPA, and perhaps IF is necessary for optimal operation.

Newer synthesized radios are not so easily convertable to the amateur bands. It's now a combination of the radio programming software or the firmware that the manufacturer burns into the radio.

Commercial gear generally has a much more rigid tolorance and specifications. They generally are not as wide-band as the amateur gear due to the rigid specs.

DJ7VY gave those numbers in an article in DL-QTC in 1974 or 75:
(the precursor of CQ-DL, the monthly newspaper of the
german ham radio club)
It was a writeup of his 1974 speech at the Weinheim VHF meeting.

Part Gain IP Noise-F dynamic range osc power
---

bipolar 18dB 10dBm 6dB 97 7 dBm

3n200 4 (1) 17 (2) 7.5 100 10

2 * 3N200 4dB (1) 21 (2) 7.5 103 10
push-pull

2 * cp643 0 (1) 34 7 112 24
push-pull hi current j-fet, Teledye-Crystalics, probably obsolete
Texas Inst. P8002 is similar, perhaps still available,

ray3 -5 33 5.5 112 26
Schottky ring mixer

sra1h -5.5 30 6 110 23
Schottky ring mixer

(1) tuned for max. IP, taking a hit in gain
40673 and 3n204 are essentially the same.

(2) IP maximum with const Vg2 and Vosc constant within 2%
DG-Fets get much worse when used with AGC

He demonstrated how these results are spoiled by the wrong
connection to the crystal filter and how this is corrected
with an isolation amplifier. He also gave a circuit for a
complete front end that was limited by sideband noise.

Now it's 25 years later. Did we make any progress?
Well, we have lots of switches and LEDs on our transceivers. :-(

Hi,

an increasing number of distributors here in Germany refuses to supply private customers and so it's really a problem here to get the non standard parts (e.g. wide bandwidth OP-Amps, dielectric resonators, medium power UHF transistors) as a private customer.

Is the situation the same in other countries?

I have a circuit in an old Radcom somewhere which is a derivative of the DAF design, it uses 4 rectifier valves arranged as a voltage quadrupler in the input stage (passive grid) which developes the screen voltage. The circuit is for only one 813, not sure if it would be ok to run a pair of them? any suggestions?

If there is interest I'll dig the circuit out and post it.

Yes, "we" did; the one approach missing in this tabulation is a switching mixer using power MOSFETs, with which an IP3 of 40 dBm or somewhat higher can be achieved as a matter of course. Such a mixer has yet to appear in an commercial amateur-oriented transceiver, probably (until now) because of the IP3s achievable with the common approaches (primarily two or four JFETs, very secondarily a diode DBM) is entirely adequate for mass-market amateur/consumer applications. (The recent discontinuance of the SD500x MOSFET quads renders the future inclusion power MOSFET mixers in consumer gear hazier still.) Mixer "strength" is not the only factor in this equation; the synthesizer purity levels of commercial amateur gear are generally insufficient to take full advantage of the dynamic range achievable with a 40-dBm-IP3 mixer. Whenever we see dynamic-range measurements qualified as "noise limited," we're seeing another in which where synthesizer noise beat out mixer "strength."

Raw front-end strength is not necessarily overridingly important to many users, and understandably so. The frequency agility, stability and repeatability of modern microprocessor-controlled radios are far more apparent--and, I would contend, important--to everyday users than 10 to 20 dBm of mixer IP3. *Of course* a manufacturer could put *all* of these characteristics in one box--but not at an everyday-user price.

While searching through a box of (mostly dead) power meter heads at the local swap-meet I found a working 478A which has an Hp sticker saying "OPTION H72 1-1000 MHz". This is not a variant that appears in any of my Hp catalogs. It does seem to have a level response and good return loss down to below 500 KHz, which is about as low as I can go, and seems to neatly fill the gap with the 432 series that is covered by the 8482 head with the 435/436/437 series of power meters.

If anyone has of what is inside I'd really appreciate hearing from them. I was actually about to think about making a thermistor head to cover this range, so that is one less project for me!

Thanks in advance

Thanks for reading this. I am in need of two 30 pF NPO disk ceramic capacitors for a repair project on an older receiver. Anyone have a couple in their junk box?

3455. Antique Radios & Test Equipment 4 Sale CHEAP!

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-29 00:00:00 UTC
From: Dean <deanntx@e-tex.com>

Hello everyone!

I have just got through adding a lot more antique radios to the site. All of them have pictures now, so there is no mestique as to what they look like. I have also added a few Test Equipment items as well. Remember, these radios are offered as is with no warranty or guarantee if they work or not. Some are missing knobs, cases, power cords, microphones or whatever. I have priced these radios and such very VERY CHEAP!
These radios are for the collectors out there that want to rebuild, restore or just to tinker with some of the older equipment, and as you will see, they are priced to sell.
We have already sold quite a lot of these old radios to a lot of you out there, so make sure you check the list out again, for it has some interesting stuff on it as well.
I want to also add that there is a new REGISTERED room on the IRC that you can chat with other people with the same interests as you, RADIOS! I know a lot of the hams out there do not like to associate with CB'ers and vice versa, but hey, we all started with that junky old CB that is long gone now.
The name of the room is #CB_Radio, and it is located on the Undernet group of servers.
It is up 7 days a week, 24 hours a day, 365 days a year now. If you are just lurking, or want to buy, sell, trade, swap, wish for or whatever your need be, this Chat Room will be a good place to start. Don't let the name of the room fool you, for it is for everyone that has an interest in some kind of radio communication.
Again, the name of the room is "#CB_Radio", and is located on the Undernet group of servers. If you need software to access the IRC, you can get the latest copy of "mIRC" on our website.
If you would like to take a look at some of the Antique Radios that we have, click or go to the URL below.

http://www.e-tex.com/cbcity

Thanks for taking the time to read this entire message. I hope that I did not offend many of you. I am not out to try and make a killing with all this, in fact I am probably taking a loss, for I am sure these radios cost us a lot more than what we are selling them for.

In Britain it is very easy to buy parts that are in the large
distributors' catalogues. They will accept credit-card orders from
anybody.

There are still difficulties in buying special parts from companies that
only supply other manufacturers or distributors in large quantities, but
even there you can have success if you approach them in a business-like
way... maybe as "Peter Bolch, RF design consultant".

tnx to Gerhard and David! I am not sure if you misunderstood my intentions, I need IP3 with mosfet or cascode jfet IF amplifier - the data quoted DJ7VY looks like being for mixer application. I might find some info from DJ7VY articles in DUBUS, UKW-Berichte, Weinheim and M&#65533;chen/Dorsten meeting tagungshefte.

Anyway, it seems interesting if you like to discuss mixers, althought this is not my intention to ask for, you are welcomed to go on, hi
